## NATIONAL SURVEY ANALYSES

Migrant Children and Communities in a Transforming Europe

The project Migrant Children and Communities in a Transforming Europe (MiCREATE) aims to stimulate Inclusion of diverse groups of migrant children by adopting child-centred approach to migrant children Integration on educational and policy level.

## PREFACE

The report presents the results of a quantitative survey conducted among children and young adults in schools in six countries: United Kingdom, Denmark, Slovenia, Austria, Poland and Spain.

This report contains three merged reports, namely:

- 6 National survey analysis on newly arrived migrant children (D5.3)
- 6 National survey analysis on long-term migrant children (D6.3)
- 6 National survey analysis on local children (D7.3)

The reports are combined into one joint report in order to provide a better overall perspective on the context of each country in relation to newly arrived children, long-term migrant children and local children. Namely, data are presented in comparative tables for the three groups of children to highlight similarities and differences between the groups in terms of their well-being, everyday life, school life and inclusion in society. In addition, the characteristics of the total survey population for each country, as well as the analysis of various demographic variables such as gender, age, socio-economic status, religion, citizenship etc., provide additional explanations for the individual country context.

The survey presents a part of research in schools in six countries that was conducted over several stages with an overall duration of app. 24 months (field-work research phase was prolonged due to COVID-19 pandemic). The objective of the survey among local and migrant children was to investigate the students' attitudes and opinions on cultural and religious pluralism, otherness, integration, etc., as well as to obtain information about their everyday life, well-being, etc. and also collect measurable indicators about migrant children`s inclusion in host societies, such as inclusion in peer groups, leisure activities, language proficiency, family dynamics etc.

The process of data collection was significantly influenced by the COVID-19 pandemic and the closure of schools. The surveys were thus collected in the period between April 2020 to May 2021.

The questionnaire was based on previous research on child well-being from a childcentred perspective, such as the European Cohort Development Project. It was translated into the national languages of the six partners as well as into different languages most commonly spoken among migrant children in each country. The questionnaires were culturally harmonised and tested by the Child Advisory Board in each country and adapted accordingly.

The following six national survey analyses consist of three parts: 1) analysis of the population, 2) analysis of the three groups of children: newly arrived migrant children, longterm migrant children and local children, and 3) analyses by different demographic variables. The analyses include the surveys, that were completed and not for example exited
in the middle, as well as those in which at least $75 \%$ of the questions were answered. In each table, the number of total answers for the question is presented.

In the national reports that follow, the terms 'child' and 'children' are frequently used when referring to the participants in the study, although we are well aware that this may sound inappropriate and inaccurate, particularly in relation to the older group (15-19 years), and that a different term would be more appropriate when referring to young people. This terminological decision arises from the fact that in our field research the integration processes were studied from a child-centred (CC) perspective. The latter is based on the UN Convention on the Rights of the Child. Therefore, the decision to use 'child' and 'children' is primarily analytical rather than substantive.

What follows are 6 national reports presenting survey data in the UK, Denmark, Slovenia, Austria, Poland and Spain. At the end of each national report there is also an appendix - a methodological section that presents the sample and methodological process in more detail.

Each national report includes a brief 1) introduction and 2) short methodological sections, a presentation of the 3) main findings from the survey, 4) conclusions and an appendix methodological section.

UNITED KINGDOM

Farwa Batool<br>Hafsah Musamood

## 1. Introduction

This report aims to highlight the integration processes of migrant pupils from a childcentred perspective. Integration in our research is defined as 'the process by which people who are relatively new to a country (i.e. whose roots do not reach deeper than two or three generations) become part of society'; it is a 'process of settlement, interaction with the host society, and social change that follows immigration' (Penninx and Garcés-Mascareñas, 2016: 11). It is important to study this from the perspective of a migrant child as their integration processes can only be supported if the factors that impact this are well understood. By treating the migrant child as the expert of their own experiences we can begin to discern the unique facilitators, barriers and challenges they face when navigating their lives in their host society. Additionally, we can tease apart migration experiences and integration processes based on intersecting characteristics such as age, gender, and ethnicity as migrant children do not form a homogenous group and there are likely to be differences based on varying characteristics. We intend that this report will provide useful insights into the experiences of this diverse group of pupils.

## 2. Methodological approach

The surveys were collected from November 2020 to January 2021 across three primary schools, three secondary schools and one online children and young people's book club. The schools and book club had a large demographic of migrant pupils with diverse linguistic and religious backgrounds. The criteria for taking part in the survey was that the participants must be between the age of 10-17. The participants were later ascribed to newly arrived, long term and local children categories based on the number of years they stated that they had been in the UK. Children who had been in the UK for three years or less were ascribed to the newly arrived category. Those who had been in the UK for longer were assigned to the long-term children category and those born in the UK were placed in the local children category. Please note that children under the age of 10 also participated in the surveys, this may have been because we targeted year 5 and year 6 pupils in primary schools to participate which occasionally include younger pupils. We decided to keep the data of these pupils as opposed to deleting it.

The process of data collection began in September 2020 but was halted numerous times as this period was at the height of the COVID-19 pandemic, and schools were following social distancing and self-isolation measures and catching up on lost class time. After numerous negotiations with schools the data collection began again in November 2020 but with many challenges and significant alterations to the study methods. One of the most challenging aspects of conducting these surveys were parental consent and the limited time school staff were able to provide to facilitate the research. We found that teachers were overwhelmed with the demands from the school setting and therefore not able to facilitate the process of consent with parents. In addition, schools were unwilling to allow researchers to enter their building, meaning researchers would not be able to facilitate survey completion.

We employed a number of strategies to ease the process of data collection in order to overcome challenges posed by Covid19 restrictions. One such strategy was the use of an opt out method of parental consent. This meant that parents would only be required to send consent forms back to the school if they did not want their child to participate. This was a carefully made decision, only implemented once literature and members of ethics board had been consulted. Where this method was employed, the teachers were asked to send letters to parents at least 10 days prior to the data collection and also inform children about the research 10 days prior to data collection. The class teachers were provided with a bespoke script by the researchers which contained information regarding the study and children's rights to consent which teachers used to communicate with the children. We then made the process of survey administration simpler by asking pupils to complete the surveys on digital devices in the school setting. On the day of the data collection children and young people were first shown a video of the researcher explaining the study in addition to their rights to consent and withdraw. The pupil consent form was built into the survey and so if they wanted to take part, they just needed to click the relevant boxes, if they did not want to take part the teacher would provide them with an alternative activity. After the video had been shown to pupils the teachers then gave children a link to the survey which they opened
either on a school device or their own handheld technology. The digital nature of the surveys helped to reduce the burden that would be placed on teachers to facilitate the research as teachers did not need to handout paper surveys, collect them, and return to the researchers. The teachers script helped to keep intact children's rights to consent and withdraw despite lack of researcher presence as the learners were aware of the research and had the opportunity to consider whether they would like to participate prior to the data collection. It was intended that the video of the researcher explaining the study would bring an impersonal aspect to the surveys as the learners would be aware that they are not participating in work set by their class teacher and instead they are partaking in research that is voluntary. This method was employed in 5 out of the 7 organisations that participated in the research. For the remaining two parental opt in consent was employed and children were given paper surveys as the school staff believed this to be the best option for their circumstances. In this case parents were sent consent forms and asked to return the forms if they would like their child to participate in the research. The researchers then sent the school paper surveys and school staff conducted the research during class time. They informed children about the study, asked them for their consent by providing paper consent forms. Once the children signed the consent forms, they collected them and handed out the paper surveys. The children completed the paper surveys on their own and once they were completed, the teachers collected them, and a member of the research team picked them up from the school.

## 3. Results

What follows is the presentation of main findings from the quantitative research in English primary and secondary schools.

### 3.1 Sample population

## Demographic data

The total number of pupils that participated in the surveys was 463, of these majority consisted of pupils from Age Group 1 (AG1), which comprised of $86 \% 1$ of pupils at age 0813. Whilst children in Age group 2 (AG2) only made up $14 \%$ of the sample. There was also an unequal divide between girls and boys in the overall sample (Girls 52\%: Boys 47\%) and across AG1 (Girls 52\%: Boys 48\%) and AG2 (Girls 55\%: Boys 45\%). Similarly, the ethnic composition was varied, with $26 \%$ pupils being Asian, $34 \%$ black, $23 \%$ white, and $17 \%$ to mixed ethnic and or other ethnic groups and. There was also an unequal divide in religions with $45 \%$ of pupils claiming to be affiliated to Christianity, $30 \%$ affiliated to Islam and the remaining to Hinduism (4\%), Buddhism (1\%), Sikhism (1\%) and other religions (2\%). Those affiliated with no religion constituted as $10 \%$ of the sample, $5 \%$ of the sample did not know which religion they are affiliated to, and $2 \%$ chose not to answer.

[^0]In relation to migrant status majority of the pupils (67\%) were born in the UK i.e., they were 'local' children, of those born outside of the UK, only $12 \%$ were classified as newly arrived and $21 \%$ as long-term migrants. These pupils were born in various countries such as Austria, Bahrain, Bangladesh, Belgium, China, Czech Republic etc. One could argue that a limitation of this research is that majority of the sample comprised of local children, however, we found that even from the local pupil's sample $70 \%$ stated that they had parents who were born in another country. This means that even majority of the local pupils have a history of migration in their family and therefore might have valuable contributions to make towards the understanding of experiences of migrants in Britain. When asked about their level of proficiency in English, 82\% of the children classified themselves as being able to speak English very well. Most pupils lived in a large city (82\%) with their family, with a fewer amount living in a town (18\%) or rural area/ village (1\%). A large number of children also agreed that they live in areas with many different race, ethnic groups, and religious groups (77\%). The pupils categorised themselves as mostly falling in the middle range of the socioeconomic status whereby they felt that in general they have the same number of things as most of their classmates (72\%). A minority of pupils felt that they had more things than their classmates (19\%) or fewer things than most of their classmates ( $9 \%$ ).

Finally, the surveys also explored children's perceptions of living in the UK. When asked if they like living in this country $77 \%$ stated yes, whilst $10 \%$ of them said no, and $13 \%$ were unsure. When asked 'If you could live in a different country, which country would It be?' children gave a variety of answers with the largest groups (18\%) of pupils wanting to stay in the United States; the remaining cited numerous other countries.

## Well-being and everyday life

Overall, most children agreed that they were satisfied with their lives (77\%) ${ }^{2}$ they have what they want in life $(68 \%)^{3}$ and that they like being the way they are $(78 \%)^{4}$. They were also positive about their future (75\%)5 and felt that they could ask for help when needed from neighbours or friends in their local area (68\%)6. Additionally, they thought that they had supportive family members who would help them if they had any problems ( $89 \%$ ) 7 and that their parents and carers listen to them and consider what they have to say (84\%)8. They held similar beliefs about their friends, whereby, they thought they had enough friends ( $87 \%$ ) 9 and that if they have a problem, they have a friend who would support them (90\%)10.

Children were asked several questions about their socialisation behaviours outside school which included, how often they meet their friends and leisure activities they participated in. Children were able to select more than one response to these questions. From the responses It can be seen that 44\% of pupils agreed with the statement that outside of school they spend time with their friends from school and $43 \%$ agreed with the statement that they spend time with other friends. Additionally, 34\% agreed with the statement that out of school they don't spend time with their friends from school (Table 28).

However, only $20 \%$ of pupils reported that they 'often' spend time with friends outside school face to face (Table 29). In fact, 67\% of pupils reported that they either rarely/never

[^1](30\%) or once or twice a week ( $37 \%$ ) meet and play with friends with a smaller number of pupils stating that they meet their friends everyday or almost everyday (34\%) (Table 26). Similarly, children spent little time in organised activities, with majority stating that they either rarely/never ( $40 \%$ ) or only once or twice a week ( $43 \%$ ) participate in leisure activities or classes outside of school (Table 26). Instead, it seems the children spent their time using their smartphone or computer to stay in touch with friends/ relatives, with $72 \%$ stating that they every day or almost every day use smartphone or computer to stay in touch with friends/relatives (Table 26). Additionally, $57 \%$ also stated that they often spend time with their friends online (Table 29) and a large proportion of children also stated that they spend time just by themselves outside of school (51\%) (Table 26).

[^2]
## School life

Children were mostly positive about their school life with most pupils reporting that they are doing very good (50\%) or at least average (46\%) in school. They also reported that mostly they like being in school with $32 \%$ stating that they often like being in school and $32 \%$ stating they sometimes like being in school. A minority of pupils stated that they never like being in school (5\%). Despite this, it was worrying to see that 120 out of 447 pupils ( $27 \%$ ) responded to this question stating that they only occasionally liked being in school. Almost half the pupils (49\%) often felt safe at school and 49\% often felt that they belong in their class. In regards to other aspects of school life children were generally okay with teachers asking them questions (often-41\%, sometimes-27\%), they felt that their teachers accepted them as they are (often-63\%, sometimes- 22\%) and they also thought that their teachers listen to them and consider what they have to say (Often-48\%, sometimes-30\%) and that they talk about different countries, cultures or religions (often-42\%, sometimes, 29\%).

More than half of students thought they often feel accepted by their classmates (51\%) and many felt that their classmates care about how they feel (often-39\%, sometimes-32\%). More than half of pupils also reported that they had never experienced physical bullying such as being hit or hurt ( $65 \%$ ) or being left out of games and activities ( $60 \%$ ). However, there was a smaller proportion of pupils who stated that they had never ( $44 \%$ ) been made fun of or called unkind names. In fact, more than half (56\%) of the participants had been subjected to this form of bulling by their peers at least once or more. When asked about discrimination they may have faced due to personal attributes such as age, gender, socioeconomic status etc an overwhelming amount of pupils felt that they had not been discriminated against by their teachers or classmates due to their gender (Teachers-85\%: Classmates-85\%), economic status (Teachers-95\%: Classmates-89\%), religion (Teachers91\%: Classmates-90\%), nationality (Teachers-86\%: Classmates-84\%), area of residence (Teachers-93\%: Classmates: 92\%) and language they speak (Teachers-89\%: Classmates88\%). In fact, $86 \%$ of pupils reported that children are allowed to speak other languages in the school, and they also reported that teachers also often (12\%) or at least sometimes (34\%) speak with children in other languages or ask pupils how some things are said in other languages.

Pupil's views and perceptions regarding children of various demographics were largely positive with most pupils ( $87 \%)^{12}$ agreeing that pupils who come to the UK from other countries should have the right to follow the customs of their countries. Additionally, children ( $95 \%)^{13}$ agreed that they liked that there are students of different backgrounds in their school and class, and they thought that pupils of different ethnicities, races and religions get along well in their class ( $87 \%)^{14}$. In fact, a majority of children themselves

[^3]reported having several (55\%) or at least a few friends (39\%) from other countries, cultures and religions.

### 3.2 Newly arrived, long-term and local children

## Demographic data

The majority of the sample comprised of local children (67\%), i.e., those born in the UK; and of these $70 \%$ had parents who were born outside of the UK. The newly arrived children compromised just $12 \%$ of the sample, and long-term pupils comprised of $21 \%$ of the sample. These pupils were born in various countries such as Zimbabwe, Syria, Libya, Slovakia, Spain, Italy etc. and spoke a range of languages inside their home, including Arabic, French, Dutch, Farsi, and Hungarian (Table 42).

In relation to gender, 59\% of newly arrived children were boys and 42\% were girls; 55\% of long-term pupils were female and $45 \%$ male. Similarly, $53 \%$ of local children were female and $47 \%$ male (Table 40). The ethnic composition of newly arrived children was largely Asian (33\%), with a smaller number of children from this group being Black/African/Caribbean (19\%), White (17\%), mixed (10\%) and other ethnic groups (21\%). Similarly, $35 \%$ of long-term children were from the Asian ethnic category with a similar number of pupils from Black/ African/Caribbean (33\%) category. The number of long-term pupils from White (12\%), mixed/multiple ethnic groups (10\%) and other ethnic groups (11\%) were much smaller (Table 41). Finally, 37\% of local children identified as being Black/African/Caribbean/ Black British, 22\% in the Asian/British Asian category, 27\% as White, $11 \%$ as mixed/ multiple ethnic groups and $3 \%$ in the other group (Table 41).

In relation to citizenship, a majority (74\%) of children considered themselves to be UK citizens whilst only $5 \%$ stated they were not. Newly arrived children ( $25 \%$ ) were more likely to not be UK citizens than long-term (7\%) or local children ( $2 \%$ ). There were small differences in the pupil's responses to where they live, with a majority of newly arrived children (90\%) stating they live in a large city, and $80 \%$ of long-term and local children stating they live in a large city. When asked the question 'Do you like living in this country' long-term children (15\%) were more likely to disagree than newly arrived (8\%) and local children (8\%).

Figure 52.1

Table 53 - Migrant Status x In the home you live most of the time, do you live with your family?

Figure 53.1

Well-being and everyday life
There were little differences in children's ratings of wellbeing indicators across the three groups, however, there were small differences in children's ratings concerning questions relating to whether they have what they want in life or if they have a problem, they can turn to others to support them. In these instances, newly arrived pupils (mean=4.12) were more likely than long term (mean= 3.67) and local children (mean=3.80) to report they could turn to others if they had problems and that they have what they want in life, however, this was not a statistically significant finding. The only significant finding in this section showcased that newly arrived on average were less likely to feel that they have enough friends (mean=4.17), as opposed to long term (mean=4.57) and local children (mean=4.43) (Table 54).

Figure 58.1

School life
Newly arrived pupils were more likely (61\%) than long-term (46\%) and local pupils ( $48 \%$ ) to say that they often feel safe at school. They were also more likely to state that they like being in school (86\%) as opposed to long term (65\%) children and local children (59\%) ${ }^{15}$. Additionally, they were also more likely to often feel OK when a teacher asks them a question ( $63 \%$ ) as opposed to long term (39\%) and local pupils (38\%). However, these differences are not statistically significant (Table 59)
. Children were asked to state the number of times they may have been discriminated against by their class teachers or friends. Overall, the majority of pupils stated that they had not been subjected to physical violence by their peers or been left out of their games and activities. However, $41 \%$ of newly arrived pupils reported having been made fun of, called unkind names, had lies spread about them, shared embarrassing information, or threatened at least once as compared to $28 \%$ of long-term pupils and $18 \%$ of local children, with these differences being statistically significant. (Table 60)

There were no statistically significant differences across the three groups in relation to experiences of discrimination by teachers or classmates due to gender, economic status, religion, and nationality. However, newly arrived (26\%) children were significantly more likely to report having been treated unfairly by their classmates due to the language they speak than long-term migrants (14\%) and local children (9\%). Additionally, newly arrived children were also significantly more likely to report being treated unkindly due to the area of their residence both by teachers (13\%) and class children (18\%) as opposed to the longterm pupils (Teachers=7\%; Children=11\%) and local children (Teachers=6\%; Children= 5\%) (Table 33) (Table 61). Interestingly, when asked about children's perceptions of their success in education newly arrived (70\%) children were also significantly more likely to report that they are doing very good at school and that their grades are good as compared to long term (58\%) and local children (45\%). (Table 62)

### 3.3 Analyses according to demographic variables

In this section the attitudes of children/youth were analysed according to various demographic variables. This section will be the basis for the crosscutting analysis.

## Age - Well-being and everyday life

There was a statistically significant difference, albeit a small one, for the question 'I have what I want in life' with 8-13-year-olds more likely to report that they have what they want in life (mean= 3.94) than 14-17-year-olds (mean= 3.70). Older children also scored lower on their perceptions of the level of social support they had. For example, older children (mean=4.48) were less likely than younger children (mean=4.53) to agree that if they have a problem their family would help them or that their friend would help them (oldermean=4.37, younger-mean=4.53), however, these findings were not statistically significant. (Table 67) There were statistically significant differences in how children spend their free time with younger children (48\%) being more likely to spend time with schoolmates outside school than older children (31\%) (Table 70). This is further corroborated by the statement "out of school I don't spend time with my friends" with $49 \%$ of older pupils agreeing to this and $33 \%$ of younger pupils agreeing to this statement. Finally, younger children (58\%) were more likely to report often spending time with friends online (gaming, chatting, using Snapchat or other social media) than older children (51\%).

Table 68 - Age к Life satisfaction

|  |  | N | Mean | Std. Deviation |

Age - School life

Older children had more positive perceptions regarding school, namely, that they were more likely to report that they like being in school (78\%) than younger children (61\%) ${ }^{16}$. Additionally, older children (78\%) were more likely to report having several friends from different countries, cultures, and religions than younger children (52\%). Younger children ( $53 \%$ ), on the other hand, were more likely than older children ( $40 \%$ ) to report that they often feel that their classmates accept them just the way they are. They also often reported that their classmates care about how they feel (40\%) than older children (28\%). Finally, younger children ( $46 \%$ ) were more likely to report that their teachers often talk about different countries, languages, cultures, and religions than older children (24\%). In regards to discrimination there were small differences in experiences of discrimination due to area of residence, with older children more likely to state that they have been treated unfairly due to their area of residence by their class teachers (13\%) and classmates (13\%) as compared to younger children (Teacher-6\%, Classmates-7\%). Please note the findings presented in this section are all statistically significant.

## Gender - Well-being and everyday life

There were statistically significant differences between children's attitudes towards themselves with boys (mean= 4.33) more likely to agree that they like being the way they are than girls (mean= 4.06). Boys (mean= 4.06) were more likely to report that they can ask for assistance if they have a problem than girls (mean=3.85), however, this difference was not statistically different. There were statistically significant differences in how children spend their free time, with $43 \%$ of girls stating that they rarely or never participate in
organised leisure activities or classes outside of school as opposed to boys 36\% boys. Additionally, boys (42\%) reported more frequently meeting or playing with friends as opposed to girls (26\%).

Gender - School life
From the statistically significant findings it can be seen that boys were more comfortable with what their fellow peers thought about them as opposed to girls, with $47 \%$ of boys reporting that they often feel OK with what their classmates think about them as opposed to $31 \%$ of girls. The number of children who reported that they were treated unfairly by class teachers or other children was relatively small, however, of those who did, boys (18\%) were more likely to report unfair treatment by their class teachers due to their gender than girls ( $13 \%$ ). There was an inverse relationship in relation to unfair treatment by class children. In this case, girls (20\%) were more likely to report being treated unfairly due to their gender by classmates than boys (10\%). Girls were more accepting of children of diverse backgrounds than boys, with more girls (mean= 4.68) stating that they agree that they like that in their class and school there are students of different backgrounds (language, religion, cultures) than boys (4.57), however, the difference here was small with most pupils being accepting of children of other backgrounds. A statistically nonsignificant yet interesting finding was that girls also reported higher levels of confidence in their educational attainment, whereby $52 \%$ of girls believed that they are doing very well in school and that their grades are good as opposed to $47 \%$ of boys.

## Ethnicity - Well-being and everyday life

The ethnicity variable was recoded into four categories, whereby 'Mixed/ Multiple ethnic groups' and 'Other ethnic group' were combined into one category, making the groups more proportional. The analysis found that Black children reported lower on wellbeing measures, such as their perception regarding the level of support available to them from people in their local area if they require assistance, with black children reporting lower levels of support (mean= 3.55) than White children (mean= 4.05). However, these differences were not statistically significant.

The following findings, however, are all statistically significant. Black (33\%) and Asian (35\%) children were more likely than White children (21\%) to 'rarely or never' meet and play with friends. Likewise, when presented with the statement 'out of school, I spend time with friends from school' Asian children (32\%) were least likely to agree with the statement as opposed to White ( $62 \%$ ), Black ( $43 \%$ ) and mixed/multiple/other ethnic group children (50\%). Black and Asian children were also less likely than white children to spend time with friends face to face out of school, with a smaller proportion of Asian (9\%), Black (19\%), and mixed/other ethnic group children (26\%) than White (33\%) children reporting they often spend time with friends face to face outside of school. Similarly, when presented with the following statement: 'out of school, I don't spend time with friends from school' Black (36\%), Asian (44\%) and mixed/other ethnic (32\%) children were more likely to state yes than White children ( $25 \%$ ), thereby supporting the previous findings that ethnic minority pupils were less likely to spend time out of school face-to-face with friends. Finally, most children stated they 'often' spend time with friends online (gaming, chatting, using Snapchat or other social media) but of these Black pupils were more likely to interact with their friends in this manner as opposed to other ethnic groups (White, 53\%; Asian, 53\%; Black, 63\%; mixed/ other ethnic groups, 58\%).

## Ethnicity - School life

The findings showed a statistically significant result for 'I feel safe when I am at school', with White (57\%) pupils more likely than Asian (48\%), Black (44\%), and mixed/other ethnic groups (48\%) to report that they often feel safe at school. Likewise, the difference in responses to 'I feel like I belong in this class' was statistically significant, with White (58\%) children slightly more like to report they often feel like they belong in their class as opposed to ethnic minority pupils (Asian, 52\%; Black, 42\%; mixed/ other ethnic groups, 44\%). In regard to relations among children with their peers, children generally felt accepted and embraced in their classes. However, white pupils (58\%) where more likely to report that they often their classmates accept them just the way they are as opposed to Asian (53\%) black (47\%) and mixed/multiple/other ethnic groups (47\%). Additionally, Black children (33\%) were less likely to report that their class mates often care about how they feel than white (42\%), Asian (40\%), and mixed/multiple/other ethnic groups (42\%).

Most children reported having never experienced bullying, such as being made fun of, called unkind names, hit, or left out of games. However, interestingly there was a significant difference in responses to how often pupils were left out of games and activities with more black (13\%), white (11\%) and mixed/multiple/other ethnic groups (11\%) stating that they had been left out of games or activities than Asian children (4\%). However, the number of pupils in each category was relatively small and so results need to be interpreted cautiously.

Additionally, the number of children who reported that they were treated unfairly by class teachers or other children was relatively small. However, of those who did, Black (22\%), Asian (14\%) and mixed/ other ethnic group (15\%) children were more likely to report unfair treatment by their class teachers due to their nationality/ race as compared to White children (3\%). Similarly, Black pupils (21\%) were more likely to report being discriminated against due to their gender by their class teachers than White (11\%), Asian (9\%) and mixed/other ethnic group (17\%) children. White (58\%) children were also more likely than other ethnic minority pupils (Asian $=42 \%$, Black $=47 \%$, mixed/other= 49\%) to state that their teachers often listen to them and take into account what they have to say. A similar trend was seen in relation to discrimination due to economic status with more Black children (17\%) than White ( $9 \%$ ), Asian ( $6 \%$ ) and mixed/multiple ethnicity pupils (11\%) reporting that they have been treated unfairly due to their economic status by their classmates. Interestingly, in regard to confidence in educational attainment Asian children (64\%) had the highest confidence in their educational attainment compared with children of all other ethnic backgrounds with $64 \%$ of Asian pupils reporting that they feel they are doing very good in schools as compared $45 \%$ of White, $44 \%$ of Black and $47 \%$ of mixed/multiple ethnic pupils. However, this was not statistically significant.

Citizenship - Well-being and everyday life
The number of children without citizenship is very low, therefore the analyses are indicative.

The large majority of the sample (73\%) considered themselves a citizen of the UK, with only $5 \%$ of the sample stating that they are not. The remaining either did not know their citizenship status or chose not to answer this question. Due to the small number of pupils that were classified as not having citizenship for the UK, it is difficult to make comparisons. A few differences were still found between children with citizenship and those without citizenship, but these findings should be interpreted very cautiously. The findings showed that children with citizenship (mean= 4.53) were more likely to report that they have a friend to turn to if they have any problems than those without citizenship (mean= 4.42). Additionally, children without citizenship (47\%) were less likely to spend time with their friends outside school than those with citizenship (40\%). However, these findings are not statistically significant. The only statistically significant difference related to children feeling that they have enough friends, with children with citizenship (mean = 4.44) being more likely to report that than children without citizenship (mean $=4.43$ ). However, being so minor, this difference lacks practical meaning.

Table 110-Citizenship x Life satisfaction

## Religion- Well-being and everyday life

A significant proportion of the sample comprised of children being from a Christian (45\%) or Muslim (30\%) faith, while all other proportions across faith categories such as Hinduism (4\%), Buddhism (1\%), Sikhism (1\%), Judaism (0\%), other religion (2\%) and no affiliation to religion (10\%), were relatively low. In addition, there were a small number of pupils who were unaware of their religious affiliation (5\%) and some who chose not to answer this question (2\%). Due to the small number of pupils within the various categories for the religion variable, it is difficult to make comparisons. In fact, no significant differences were between all faith groups across the various well-being and everyday life measures.

Religion- School life
The findings for whether pupils feel safe at school were statistically significant. Children across most faith groups such as Christianity (50\%), Islam (53\%), Hinduism (61\%), and Sikhism (67\%) reported more often feeling safe at school compared to children who were affiliated with Buddhism (33\%) or those from other religions (43\%), and those not affiliated with a religion (37\%). Concerning relations among pupils and their peers, pupils across all faith groups generally felt accepted in their classes. Most children reported having never experienced bullying in the form of being physically hit or hurt by their peers (Christianity, 63\%; Islam, 68\%; Hinduism, 78\%; Buddhism, 67\%; those from other religions, 40\%; those not affiliated with a religion, 73\%). The proportion of pupils who reported that they were treated unfairly by class teachers or other children was relatively small. However, the statistically significant results revealed that Muslim pupils (19\%) and those from other religions (25\%) had higher rates of reporting unfair treatment by their class teachers due to their religion compared to all other faith groups. In regard to how successful pupils feel in relation to their classmates, Hindu pupils (88\%) had substantially higher confidence ratings for their perception of doing well in school, followed by Muslim (55\%) and Christian (47\%) students, compared to Buddhists (33\%), Sikhs (33\%), those from other religions (20\%), and those not affiliated with a religion (40\%). However, these differences were not statistically significant. Again, it is to be reiterated that the number of pupils in some categories was very small and so it is difficult to make meaningful conclusions.

## Socio-economic status - Well-being and everyday life

The socioeconomic status of pupils was measured by their answer to the question: 'In general, I have either more, about the same or a smaller number of material things than most of my classmates'. Those who stated that they have more things than their friends were classed as having a higher socioeconomic status, those stating that they have the same amount of things as their classmates were classified as having an average level of socioeconomic status, whilst those who stated that they have less (material) things than their classmates were classified as being in the lower socioeconomic status group. In total, 18\% of the sample was categorised in the higher socioeconomic group, $68 \%$ in the average socioeconomic group and $9 \%$ in the lower socioeconomic group.

The following results were statistically significant. Findings indicated that those in the lower socioeconomic status group were less likely (mean= 3.51) to report feeling satisfied with their lives as opposed to those in the average (mean= 4.22) and higher socioeconomic status groups (mean=4.21). They were also less likely to report that they have what they want in their life (mean= 3.51) and that they like being the way they are (mean= 3.80) as opposed to the average (mean= 4.22: 4.25) and high socioeconomic (mean= 4.21: 4.22) groups. Additionally, they were less likely to feel positive about their future (mean= 3.51) and feel that if they have a problem they can ask for assistance from others (mean=3.20) than the average (mean= 4.14: 3.88) and high socioeconomic groups (mean= 4.11: 3.71). In
relation to parental support, children in the lower socioeconomic group were less like to report that if they have a problem their family would help them (mean=4.09) than middle (mean= 4.60) and higher socioeconomic groups (mean= 4.43). They were also less likely (mean=3.68) to report that their parents (carers) listen to them and considered what they say than the average (mean= 4.40) and higher socioeconomic groups (4.36). Additionally, they were less likely to report that they have enough friends (mean= 4.0) as compared to average (mean= 4.53) and higher socioeconomic groups (mean= 4.38). Other findings indicated that those from a lower socioeconomic group (58\%) were less likely to participate in organised activities than those with higher socioeconomic background (42\%); however, this was not statistically significant.

Table 138 - Socio-economic Status

|  | F | \% |
| :--- | :---: | :---: |
| In general, I have more (material) things than most of my classmates | 84 | $18.1 \%$ |
| In general, I have about the same amount of things than most of my classmates | 314 | $67.8 \%$ |
| In general, I have less (material) things than most of my classmates | 40 | $8.6 \%$ |
| Total | 438 | $94.6 \%$ |

Those of a lower socioeconomic background were more likely to report only occasionally feeling safe ( $41 \%$ ) than those in the average (12\%) and higher socioeconomic groups (25\%). They were also less likely to feel 'OK' when a teacher asks them a question, with only $21 \%$ reporting that they often feel 'OK' when a teacher asks them a question as opposed to $45 \%$ of those in the average socioeconomic group and $38 \%$ of those in the higher socioeconomic group. The lower socioeconomic group also rated themselves as much lower on feelings of acceptance by their class teachers, with only 47\% reporting that their teachers accept them the same way as other classmates as opposed to $67 \%$ of the average socioeconomic group and $61 \%$ of the higher socioeconomic group. Higher ratings of experience of bullying by classmates was also reported by the lower socioeconomic group, with $29 \%$ of these pupils reporting they had been made fun of more than 3 times as compared to $11 \%$ of those in the middle socioeconomic group and $22 \%$ of those in the higher socioeconomic groups. Additionally, 22\% of those in the lower socioeconomic group reported that they had been left out of activities and games as compared to 7\% of the average socioeconomic group and $13 \%$ of the higher socioeconomic group. Those with less material things were also more likely to report that they had been treated unfairly by their teachers due to their gender (34\%), area of residence (27\%), religion (24\%) and language they speak ( $23 \%$ ) than those with average material things ( $10 \%: 4 \%: 6 \%$ : $8 \%$ ) and those with more material things ( $25 \%$ : 12\%: 15\%: 16\%). Those with less material things were also more likely to report that they were treated unfairly by their classmates due to their religion (27\%), language (31\%) they speak, and economic status (30\%) than those with average material things (7\%: 7\%:7\%) and those with more material things (18\%: 20\%:15\%). Finally, in relation to the statement 'In our class, pupils of different ethnicities/races/religions get along well, those belonging to average socioeconomic group (4.49) were more likely to agree than those in higher socioeconomic (4.15) and lower socioeconomic group (4.03). Please note the findings presented in this section are statistically significant.

## 4. Conclusions and discussion

The survey aimed to assess children's wellbeing, experiences and challenges related to migration and whether these may have been mediated by individual characteristics such as migrant status, socioeconomic status, age, gender, citizenship, and ethnicity. We found that overall children rated themselves high on wellbeing indicators as they were positive about their future, satisfied with their lives and felt that they had individuals who they can turn to for support. This was largely irrespective of the migrant status of the child. These findings are in line with findings from the qualitative research whereby children reported being positive about the various dimensions of their lives. Migrant children's lives can contain elements of displacement and a profound sense of loss, caused by the relocation to unfamiliar societal and school cultures. Children are required to grapple with the unfamiliar experiences in their new host societies and to quickly become accustomed to the language, people, and rules to function in their new environment (Hamilton, 2012). Therefore, the findings that overall, pupils were satisfied give cause for celebration.

The findings also showed that pupils were in large were positive about their school lives, many enjoyed going to school, felt safe and had a sense of belonging to their class. However newly arrived children were more likely than long term and local pupils to report themselves as doing very good at school. Newly arrived pupils positive feelings can be associated with the efforts that schools put into place to support migrant children. For example, findings of work package 4 and interviews conducted as part of work package 5-7 revealed that schools employed a range of good practices for newly arrived pupils to help them to integrate and feel well settled.

Interestingly, although newly arrived children rated themselves high on school satisfaction indicators it seems these pupils experienced more discrimination and bullying than local and long-term migrants. For example, a larger number of newly arrived pupils reported that they had been name-called or had embarrassing information shared about them by their class friends and had been treated unfairly by their peers due to the language they speak. Also, it was worrying to see that $15 \%$ of the sample had been discriminated against by their class teachers and peers due to their gender. Further analysis indicated that boys were more likely to report being discriminated against due to their gender by their class teachers whilst girls were more likely to report being discriminated against due to their gender by their peers. This issue needs further pursual in order to understand the full picture.

The participant's views and perceptions regarding children of diverse backgrounds were also positive, with $87 \%$ agreeing that pupils who come to the UK from other countries should have the right to follow the customs of their countries. Additionally, all most all pupils in the surveys agreed that they liked that there are students of different backgrounds in their school and class and they thought that pupils of different ethnicities, races and religions get along well in their class. In fact, most children themselves reported having several friends from other countries, cultures and religions. This corroborates the findings of the qualitative aspects of the research whereby we found that children advocated for multiculturality and diversity within their schools and that most pupils had friends who had a migratory or minority background irrespective of their migrant status. However, a limitation of these surveys is that they do not assess the level of mixing between children of minority groups and majority groups. Qualitative data from WP5-7 showed a propensity for children to primarily be in migrant friendship groups. Out of 51 children who were interviewed, a minority of pupils referred to White British children as their friends, additionally, participant observations showed children remained largely within their ethnic groups.

When asked about school culture and whether within their settings children were allowed to make use of their native languages, $86 \%$ of pupils reported that children are allowed to speak other languages in the school and $12 \%$ of pupils also reported that teachers 'often' or at least sometimes (34\%) speak with children in other languages or ask pupils how some things are said in other languages. These findings show that teachers take the initiative to not only promote an acceptance of minority languages but also interact with the languages of their pupils through asking questions. This is a positive finding as literature shows that the promotion of minority languages can be beneficial for migrant pupils. For example, Janta
and Harte (2016) in their policy brief argue that migrant learners should be facilitated in maintaining a relationship with their mother tongue as it can be useful in building relationships between educators and parents. This came across in the qualitative findings as well, as a minority of children who spoke about their teachers incorporating languages in the curriculum were positive about it. For one child it meant that his class teacher could communicate with his non-English speaking parents whilst for another hearing his language being spoken about and discussed in the class gave him an opportunity to interact with his fellow peers. Some children relayed their concerns that with the emphasis on English learning they were beginning to forget their home languages which played a significant role in their life, for many this was a primary means of connecting with families and friends they had left behind, for others this was incorporated into their identities. Therefore, schools should continue to support the dual languages of migrant pupils.

Pupil's responses about how they spend their free time was concerning with less than half the pupils agreeing with the statement that they spend time with their friends outdoors or engage in leisure activities frequently Instead children spent time alone, or on their phone using social media. The scientific literature has been raising alarms for several years about children and young peoples' reduced engagement in outdoor activities (Mullan, 2018). In the context of migrant children, leisure activities such as sports and physical activity can be a tremendous source of integration. The playing of sports has been associated with the production of cultural capital that is recognised and valued by dominant culture; this includes increased proficiency in the host language and knowledge of the culture of receiving country (Smith, Spaaij \& McDonald, 2018). Additionally, playing sports can also help maintain and further build migrant specific culture capital as by playing sports with individuals of one's own background children can keep an affiliation to their native language norms and customs (ibid). By not being actively involved in these activities children are missing out on building important forms of social capital. It seems girls suffer more as they are less likely than boys to engage in leisure activities and or meet friends. Given the importance of sports and physical activity in the integration processes of migrants, relevant bodies such as charities, schools and policymakers must do more to ensure increased participation of this group in sports.

Additionally, the surveys were conducted at the height of the Covid-19 pandemic, and although children were explicitly asked to answer questions about leisure activity according to what they did prior to the pandemic, one cannot be entirely sure whether these findings are reflective of the pandemic or this is generally how they spent their time. A small number of interviews conducted during the same period showcased that children's activities had reduced due to the pandemic and some stated that they felt isolated and missed being able to see their friends. The impact of Covid-19 on migrant pupil's lives remains an unanswered question that is in dire need to be addressed. Pupils across the country have suffered emotionally, and academically. However, it is believed that certain marginalised groups are more likely to feel the effect of the pandemic than others (Gornik, Dežan, Sedmak \& Medarić, 2020); therefore, it is more imperative that going forward this topic is researched.

To conclude, overall children were satisfied with their lives and positive about their futures with newly arrived children generally rating higher on these indicators than long term and local pupils. However, these pupils were also more likely to report incidences of unfair treatment and discrimination. Additionally, migrant children's lack of engagement with leisure activities is worrying given the benefits this has in not only promoting mental and physical wellbeing but also cultural capital.

## 1. Introduction

This report contains the results from quantitative research conducted in Denmark in 2020 and 2021. The survey analyses provide information about measurable indicators of children's wellbeing, everyday life and school life, their values and attitudes, with the aim of contributing with new knowledge on inclusion of migrant children.

After this introduction, a methodological overview is presented (chapter 2). Then, the results are presented divided into three sections (chapter 3). The first section (3.1) contains demographic data and respondents' perception of wellbeing and everyday life and school life, to provide an overview of the whole study sample. In section 3.2 the responses are analysed according to migration experience and thus divided into two groups: a) migrant children (born abroad) and b) local children (born in Denmark).In section 3.3 crosscutting analyses are made: responses on wellbeing and everyday life and school life are crosscut with the following demographic variables: age, gender, ethnicity, citizenship, religion, and socio-economic status.
2. Methodological approach

The data for the quantitative report were collected in the autumn of 2020 at seven schools. Five of these schools were from the original sample of six fieldwork schools, and two additional schools were added to secure the sample size. Gatekeepers at schools helped to identify participants. No consent from guardians was necessary according to Danish GDPR regulations, since the surveys were totally anonymous. 517 children and adolescents answered the survey (sample size: 517).

At two schools, the survey was implemented face to face with a researcher being present, while it was implemented face to face without a researcher being present at three schools. At one school, the survey was implemented online (CAWI) during lockdown. At the last school the survey was implemented face to face in some classes and online (during lockdown) in other classes - in both these cases a researcher was present, face to face respectively via online video connection, to assist the children. Five researchers participated in the process, facilitating either CAWI responses or face to face responses.

School staff facilitated the research by being present in class while students filled out surveys and answering technical and semantic questions. Researchers facilitated staff by being present in class while students filled out surveys, answering technical and semantic questions, and in classes where they had not access, guiding school staff by email.

Main difficulties experienced were that some questions were difficult to understand and/or to read (especially for children aged 10-13), that it was difficult for respondents to fill out the survey when not being physically present with their teacher, and that one fieldwork school withdrew so that two other schools had to be recruited to reach the sample size. In the group of respondents, a slightly higher percentage of those aged 9-13 than those aged 14-18 have Danish citizenship. Most of those not knowing if they have Danish citizenship are aged 9-13 (Table 12). A third of the respondents have at least one parent born in another country than Denmark (Table 13).

## 3. Results

What follows is the presentation of main findings from the quantitative research in Danish primary and secondary schools.

### 3.1 Sample population

## Demographic data

In this section a description of the data by demographic characteristics is presented. In the group of respondents aged 9-13 years, most were girls (54\%) (Table 2 and Table 3), while the group of respondents aged 14-17 years, the proportion of boys and girls was almost
equal (Table 4). Generally, very few respondents in the study reported identifying as neither boys nor girls (Table 3).

Respondents were asked in an open text box which language(s) they spoke at home. 350 respondents report that they speak one language at home, with Danish (68\%) and Arabic ( $4.7 \%$ ) being the most frequently mentioned. 56 respondents said they speak two languages at home, with Danish and English (4.1\%) being the most common combination. Only three respondents who speak two languages do not have Danish as one of them. 11 respondents report speaking three languages. Of these, nine have Danish and English as two of their three languages. 16 respondents left the field blank or had illegible answers (Table 5). Almost all respondents to the survey speak Danish. Almost four-fifths of respondents say they speak it 'very well'. However, almost one fifth of respondents say they speak Danish well. Only 3\% of respondents say they speak Danish 'not well', 'little' or 'not at all' (Table 6).

Most of the respondents were born in Denmark, while 15\% reported they were born abroad. (Table 7). Almost $85 \%$ of the respondents were born in Denmark. Of the $15 \%$ born abroad, 20 respondents ( $3.9 \%$ ) were born in Western countries and 57 (11.1\%) in nonWestern countries. The most represented countries of origin are Syria and Somalia. 31 respondents (6\%) were born in Syria and 9 (1.76\%) in Somalia, most likely reflecting the relatively large groups of Syrian and Somali refugees who have arrived in Denmark in recent years (Table 8). The distinction between Western and non-Western countries refers to the official Danish state categorisation of countries, which is mainly used in statistics on immigration. According to Statistics Denmark, the term 'non-Western countries' includes all countries except EU and associated countries, as well as Canada, the USA, Australia and New Zealand (Elmeskov, 2019).

The majority of respondents (85\%) were born in Denmark. Newly arrived migrant children are those who arrived in the country three years ago or less. Long term migrant children have been in Denmark for more than three years (Table 9). Unfortunately, in this report it is only possible to divide the children into migrant children and local children. This is due to the fact that the question about migrant respondents age at the time of their arrival was not asked in the Danish survey. More than $80 \%$ of the respondents report having Danish citizenship (Table 10). Table 12 shows that more girls than boys report having Danish citizenship. Similarly, more respondents aged 9-13 say they have Danish citizenship (Table 11). Among the group of respondents, a higher percentage of girls than boys say they have Danish citizenship. $5.1 \%$ of the respondents state that they do not know whether they have Danish citizenship. At least one parent was born in another country (Table 13).

Almost half of the respondents say that they belong to Christianity, which in Denmark most often means that they are associated with the Evangelical Lutheran Church. One fifth of the respondents say that they are affiliated with Islam. Another fifth say they do not belong to any religion. One in 10 say they do not know if they feel they belong to a religion (Table 14).

Most respondents say they live in small cities, towns or large cities. One fifth live in a large city and six out of 10 live in a town or small city. Only $16.7 \%$ of respondents say they live in rural areas or villages (Table 15). Half of the respondents report that they live in areas characterised by a wide diversity of national, religious and linguistic backgrounds. But a quarter of the respondents do not know whether this is the case or not (Table 16). Almost all respondents like living in Denmark (Table 17). Respondents were asked in an open - ended text field which country they would like to live in if they could live in another country. Since some chose two or three countries, there are more responses (562) than respondents (517). The USA, England, Denmark, Spain, Italy, France and Germany are the most popular countries (Table 18). Only $6 \%$ of respondents say they have fewer things than others in their class, suggesting that they may have less privileged living conditions. Almost one fifth say that they have more things than their classmates, indicating privileged living conditions (Table 19). Almost all respondents say that they live with members of their family (Table 20).

## Well-being and everyday life

In relation to the four questions on life satisfaction, between $75 \%$ and $87 \%$ of respondents report that they agree or strongly agree, while between $3 \%$ and $8 \%$ of respondents say they disagree or strongly disagree, expressing a high level of life satisfaction (Table 21).

28\% of respondents indicate that they rarely or never participate in organised recreational activities, $14 \%$ say they rarely or never meet friends or play physically when they are not at school. However, responses from COVID -19 lockdowns, as the survey was answered in the fall of 2020. More than eight in ten respondents say they are in contact with friends and relatives online via smartphone or computer every day or almost every day (Table 22).

A large majority of respondents report that they feel that their family helps and listens to them, that they have enough friends and that their friends will help them if needed (Table 23).

Many respondents report spending time with friends when they are not at school. While nearly eight in 10 spend time with friends from school in their free time, six in 10 spend time with friends who are not from their school. Almost $12 \%$ say they do not spend time with friends in their free time (Table 24). While a quarter of respondents say they often spend time with their friends face to face out of school, almost half often spend time with their friends online when they are not at school. About 10\% of respondents report that they never or rarely spend time with friends when they are not at school (Table 25).

Figure 25.1

School life

Less than 10\% of respondents answered 'never' or 'rarely' to questions about well-being and feeling safe, belonging and accepted at school. More than $70 \%$ answer 'sometimes' or 'often', which means that most respondents sometimes or often feel comfortable at school sometimes or often (Table 26).

The vast majority of respondents say they feel comfortable at school. Only very few seem to feel that they are not accepted at school. They report that their teachers and classmates listen to them and care about them. However, a smaller proportion report that their teachers talk about different countries, languages, cultures and religions at school. Only a quarter report that this happens frequently (Table 27).

One-third of respondents report that in the school year in which the survey was conducted (which was in the first half of the school year), they experienced being excluded and ridiculed at games or activities. A quarter of the respondents reported that they have experienced being hit or hurt (Table 28). Less than $10 \%$ of respondents feel they have been treated unfairly by classmates or teachers. This is true for all questions. Gender and place of residence are the most common reasons for unfair treatment, while unfair treatment based on economic status is the least common (Table 29).

A quarter of respondents (24\%) report that they were not allowed to speak any language other than Danish in the school corridors o or during breaks (Table 30). Additionally, one third of the study participants (34\%) report that teachers do not include languages other than Danish as a resource in the lessons (Table 31).

Almost one-third of respondents feel that they do better than average in their class, while six out of 10 rate themselves as average compared to their classmates (Table 32). Respondents have positive attitudes towards migrants and towards linguistic, cultural and religious diversity in society and school (Table 33).

Most of the respondents have friends from other countries. Very few have no friends from other countries (Table 34).

### 3.2 Migrant (newly arrived and long-term) and local children

In this section the responses are analysed according to migration experience and thus divided into two groups: a) migrant children (born abroad) and b) local children (born in Denmark).

## Demographic data

For both migrant and local children, a slightly larger proportion of respondents belong to the youngest age group (9-13 years) (Table 35).

Among local children (Danish-born) children, more girls are among the respondents, while it is the other way round among migrant children (Table 36).

Regarding ethnicity, we distinguish between three groups: a) children born abroad (migrant children), b) children born in Denmark, both parents born abroad, and c) children born in Denmark, one or both parents born in Denmark. The latter category corresponds to the category "non-immigrant student" in OECD PISA surveys, in which students are considered to be non-migrant if at least one parent was born in the country where the student lives (OECD, n.d.).

Furthermore, the national background of both migrant children and children born in Denmark with migrant parents (Table 41) indicates that a large proportion of respondents come from countries categorised as non-Western in Danish statistics (see p. 5). Apart from having a migration experience or history of migration in the family, it is therefore reasonable to assume that these respondents belong to ethnic minorities. Therefore, the ethnicity of local children is divided into two groups: children with both parents born abroad (14\% of the study sample) and children with at least one parent born in Denmark (70\%) (Table 37).

Among respondents born in Denmark, Danish is the most commonly spoken language. $78 \%$ say they speak Danish at home. Almost 5\% report speaking Danish and English, while $2.3 \%$ speak Arabic and $1.8 \%$ speak Somali (Table 38). Among foreign-born respondents born abroad, about one-fifth speak Arabic as their mother tongue, while $15 \%$ report that they speak only Danish at home (Table 39).

Danish-born respondents report speaking Danish very well. Only 0.5\% of the local children say they speak little Danish, while $13 \%$ say they speak Danish well. On the other hand, $40 \%$ of the newly arrived and long-term migrants report speaking Danish very well, while $2.5 \%$ report not at all speaking Danish (Table 40).

The most common countries of origin are Syria and Somalia. Almost 4 out of 10 (31 respondents) were born in Syria and more than one out of 10 (9 respondents) in Somalia, most likely reflecting the relatively large number of Syrian and Somali refugees who have arrived in Denmark in recent years (Table 41).

Almost all local children claim to have Danish citizenship, while less than a quarter of the newly arrived and long-term migrants claim this. As mentioned above, the experience of the researchers who were present when the survey was answered suggests that respondents are not sure what citizenship is and may confuse it with residence permit. Almost a quarter of the newly arrived and long-term migrants and 5\% of the locals don't know whether they have Danish citizenship. This number could probably have been higher if the teachers and researchers who were present when the survey was filled out had not explained the meaning of citizenship - even though such explanations did not necessarily lead to correct answers (Table 42).

Only two foreign-born respondents state that their parents were born in Denmark. About a quarter of the local children who were born in Denmark say they have one or two parents who were born in another country (Table 43).

A larger proportion of newly arrived and long-term migrant respondents - almost six out of 10 - than local respondents (one out of 10) report that they feel they belong to Islam. A larger proportion of local respondents (about two in 10) than migrant respondents (one in 10) say they do not belong to any religion. A larger proportion of native respondents say they don't know if they feel affiliated with a religion (13\%) than newly arrived and longterm respondents (4\%) (Table 44).

The proportions of newly arrived and long-term respondents and local respondents living in large cities are almost equal, while a larger proportion of local respondents report living in rural areas and villages (Table 45).

More newly arrived and long-term respondents than local respondents report living in a diverse environment in terms of national, religious and linguistic background. Since many respondents said they did not know this, the validity of examining the relationship between migrant status and the experience of living in national, religious or linguistic diverse environment is questioned (Table 46).

A slightly larger proportion of local than migrant respondents say that they like living in Denmark (Table 47).

Respondents were asked which country they would like to live in if they could live in another country, in an open-ended text field. Since some chose two or three countries, there are more responses (478) than respondents (435). Among Danish-born respondents, the most popular choices are the USA, England, Denmark, Spain and Italy (Table 48). Similarly, among migrant children some chose two countries, therefore there are more responses (84) than respondents (80). England, the USA, the United Arab Emirates, Spain and Denmark are the most popular choices among migrant respondents (Table 49).

The proportions of respondents who said they owned more, about the same or less than their classmates (indicating socio-economic status) are quite similar (Table 50).

Among both local and migrant respondents, almost all respondents report living with family members (Table 51).

## Wellbeing and everyday life

In both groups, the proportions of those who say they are satisfied with their lives and those who have a positive view of their future are almost equal. Migrant respondents tend to answer more positively to the statement "I like being the way I am", while the local respondents respond more positively to the statement "I have what I want in my life" (Table 52).

Patterns of social contact seem to be quite similar for both groups. However, a larger proportion of migrant respondents say that they never spend time alone than local respondents (Table 53). With regard to the expected helpfulness and acceptance of family, parents or other carers, responses of the two groups are almost the same. However, migrant respondents are less likely to agree that they have enough friends. On the other hand, the migrant respondents do agree slightly more often that a friend would support them if they were in need (Table 54).

A larger proportion of migrant respondents - 27\% - say that they do not spend time with friends in their free time, compared to $12 \%$ of the local children. Apart from this difference, both figures seem high. However, as mentioned above, it should be noted that the survey took place during the COVID -19 pandemic, when a larger number of children and young people felt they missed their friends ( $92 \%$ of respondents in a Danish survey (Ovortrup et al., 2020: 6) (Table 55).

Migrant respondents report never or rarely spending time with their friends to a greater extent than local respondents, while patterns of spending time with friends online differ less between the two groups (Table 56).

Figure 56.1
School life

Migrant respondents, as well as local respondents, state that they like going to school. However, a larger proportion of migrant respondents than locals report that they often enjoy being at school, feel safe at school, feel that they belong in their class, feel OK when asked questions by teachers, and feel OK about what their classmates think of them (Table 57). A larger proportion of respondents with a migrant background say that they often feel accepted by their teachers and listened to. Regarding acceptance by classmates and teachers talking about different countries, languages, cultures or religions, there are no major differences between the groups (Table 58).

Regarding peer behaviour in terms of bullying, exclusion and harassment, the answers are almost equally distributed in both groups (Table 59). Respondents with a migration background state to a greater extent that they feel treated unfairly by teachers and fellow pupils than local respondents. This is especially true for gender, economic status (more often by classmates than by teachers), religion (more often by teachers), nationality (more often by teachers), district (more often by teachers) and language (more often by classmates) (Table 60).

One fifth of the local respondents and one third of the newly migrant respondents state that children are not allowed to speak other languages than Danish when they are at school during breaks, in the corridors and when playing (Table 61). Among both migrant and local respondents, about one third say that their teachers do not use languages other than Danish during classes (Table 62).

A slightly larger proportion of migrant respondents feel that they are less successful than their classmates (Table 63). It seems that migrant children are slightly more positive towards migrant children right to follow the customs of their countries of origin somewhat more positively and also view diversity in the classroom somewhat more positively (Table 64). A smaller proportion of local than migrant children say they have several friends from different countries. However, the proportions reporting that they don't have friends from other countries or do not know are quite similar. Therefore, a large majority in both groups report they have friends from other countries, but more migrant respondents report that they have several (Table 65).

### 3.3 Analyses according to demographic variables

In this section crosscutting analyses are presented: responses on wellbeing and everyday life and school life are crosscut with the following demographic variables: age, gender, ethnicity, citizenship, religion, and socio-economic status.

## Age - Wellbeing and everyday life

When comparing age groups, 14-18-year-olds report less positive feelings regarding life satisfaction, having what they want in their life, being who they are, and the future, than 813 year olds (Table 66).

There are also differences between the age groups in terms of leisure activities and social contacts. In the younger group, a larger proportion say they participate in organised leisure activities, while the number of meetings with friends is almost the same in both groups. The older respondents are more likely to use smartphones or other devices to keep in touch with friends and relatives than the younger ones. Finally, a larger proportion of the older group say they spend time just being with themselves almost every day (Table 67).

The age groups also differ in terms of experiences of help, support and listening from family. A lower proportion of older respondents feel that their parents or caregivers listen to them and that their family is willing to help them. Also, a lower proportion of older
respondents report that they have enough friends. However, the proportions of respondents who believe that a friend will support them if they need it are almost the same (Table 68).

While few respondents in each group never or rarely spend time with friends when they are not at school, the type of contact varies between groups. The older respondents tend to have more online contact, while the younger ones tend to meet in person (Table 69).

Figure 70.1

## Age - School life

Regarding school life, there are some differences between the age groups. In general, the younger group seems to more often like being in school, and they are more likely to feel safe, to feel that they belong in the class, and to feel comfortable when asked questions by their teachers and with what their classmates think about them. In all these cases, the older group tend to answer 'sometimes' rather than 'often' (Table 71).

Regarding feeling comfortable at school, there are differences between the age groups. While six out of 10 in the younger group often feel accepted by their classmates, and three out of 10 sometimes feel accepted by their classmates, only half of the older group often and four out of 10 sometimes feel accepted. A similar tendency applies to the feeling of acceptance by classmates. Regarding the feeling of being listened to by teachers, the answers of the younger and older respondents are more similarly distributed. Eight out of 10 of the younger respondents and nine out of 10 of the older respondents report that their teachers often or sometimes listen to them and take into account what they say. Finally, while almost six out of 10 in the younger group report that their teachers sometimes or often talk about other countries, languages, cultures or religions, this is true for only half of the older respondents (Table 72).

There is a difference between the age groups in terms of experiences that can be linked to bullying, harassment and social exclusion. A larger proportion of the older group report that they have never experienced bullying, violence and exclusion in this school year (Table 73).

As far as the experience of unfair treatment by classmates and teachers is concerned, there are no noticeable differences between the age groups. However, in the younger age group, almost one in 10 say they have been treated unfairly by classmates because of their gender and by teachers because of where they live. In the older age group, $8 \%$ say they have been treated unfairly by teachers because of their gender (Table 74).

In the study sample, being in the age group and being allowed to speak other languages in the hallways or while playing at school was significantly moderately associated, $\mathrm{V}=0.326, \mathrm{p}=.000$. A significantly smaller proportion of students in the youngest age group ( $63 \%$ ) than in the oldest age group (91\%) reported being allowed to speak other languages at school (Table 75). A slightly larger proportion of 8-13-year-olds (51\%) than 14-18 year olds ( $43 \%$ ) reported that their teachers often or sometimes included other languages in lessons (excluding foreign language lessons) (Table 76).

A slightly smaller proportion of the older age group than the younger group report that they do better than average in their class. The share of respondents who say they do not do as well as average is the same in both age groups (Table 77).

In terms of recognising the right of newcomers to follow their customs and cultural expressions, the level of positivity is significantly lower in the older group. The older group is also significantly less positive about diversity in class and the different groups' getting along than the younger age group (Table 78).

Almost nine out of 10 in both age groups (89\% of 8-13-year-olds and 87\% of 14-17 year olds) say they have either several or a few friends from different countries (Table 79).

## Gender - Well-being and everyday life

While there was a possibility for children to select also the answer "other", the number was too little to make any comparative analyses, therefore these answers were left out. There are some gendered differences when it comes to life satisfaction and positive feelings about the future. While boys report a higher degree of satisfaction with their lives, and with being the way they are, girls report a higher degree of feeling positive about their future (Table 80).

Regarding social contact and leisure activities, there are some gendered differences. Boys report a higher frequency of participating in organized leisure activities. While three out of 10 boys participate in such activities every day or almost every day, this only goes for two out of 10 girls. Half of the girls participate in organized leisure activities once or twice a week, while three out of 10 girls rarely or never do. Regarding meeting and playing with friends, more boys than girls report doing it every day or almost every day. However, the proportion of boys reporting that they rarely or never spend time with friends are slightly larger than for girls. The patterns of virtual contact with friends or relatives and spending time by oneself are more similar (Table 81).

Regarding experiences of family help, support and listening, some gendered differences appear. Boys to a lesser degree tend to feel that their parents or carers listen to them, and that if they have a problem, a friend will help. Regarding expectations of help from family, and experience of having enough friends, there are not big differences between the genders (Table 82)

A slightly larger proportion of girls report that they spend time with friends out of school, while a slightly larger proportion of boys report that they don't spend time with friends (Table 83). Regarding spending time with friends face to face and online, when not in school, girls and boys report quite similar patterns (Table 84).

## Gender - School life

Regardless of gender, children enjoy being at school, feel safe at school, feel like they belong to the class and are OK when a teacher asks them a question. They also feel OK what their classmates think of them (Table 85).

There are also no significant gender differences with regard to relationships at school, as both girls and boys feel accepted and listen to by their teachers and classmates. About the same number (more than 50\%) also agree that teachers often or almost always talk about other countries, languages, cultures or religions (Table 86).

A slightly larger proportion of girls (eight out of 10) than boys (7 out of 10) say they have never been hit or hurt during this school year, while a larger proportion of boys report that
they have never been excluded by their peers in games or activities at school ( $75 \%$ boys compared to $62 \%$ girls) (Table 87).

There is a significant but weak association between the gender of the respondent and the feeling of being treated unfairly. Thus, a greater proportion of boys answered yes to being discriminated against because of their gender. In addition, a larger proportion of boys feel unfairly treated by teachers on grounds of their religion and where they live (Table 88).

A slightly larger proportion of girls report that they are not allowed to speak other languages at school during breaks and when playing (Table 89). A larger proportion of boys (18\%) than girls (13\%) report that their teachers include other languages in their lessons (foreign language teaching) (Table 90).There are almost no gender differences when it comes to respondents' assessment of how well they do in school (Table 91).

For all questions on acknowledgment of newcomers to follow customs and keep cultural expressions, diversity in class and getting along with each other, there seems to be a higher degree of positive attitudes among girls than among boys (Table 92). Slightly more boys than girls report that they have several or a few friends from other countries (Table 93).

## Ethnicity - Well-being and everyday life

Regarding ethnicity we distinguish between three groups: a) children born abroad (migrant children), b) children born in Denmark, both parents born abroad, and c) children born in Denmark, one or both parents born in Denmark. The latter category corresponds to the category »non-immigrant student« in PISA surveys, in which students are seen as without an immigrant background if at least one of the parents was born in the country, where the student lives (OECD, n.d.).

Furthermore, the national backgrounds of both migrant children and children born in Denmark with migrant parents (see table 1.8) point to a large share of the respondents being affiliated with countries categorised as non-western in Danish statistics (see p. 8). Besides from having a migration experience or migration history in the family, it is therefore reasonable to assume that these respondents belong to ethnic minorities.

Thus, the ethnicity of local children is divided into two groups: children with both parents born abroad ( $14 \%$ of the study sample) and children with at least one parent born in Denmark (seven out of 10). In other words, the ethnicity may be described as migrants (children born abroad), locals with a migrant background (children born in Denmark, both parents born abroad), and locals without a migrant background (one or both parents born in Denmark) (Table 94).

Regarding life satisfaction, positive feelings about the future, and especially having what they want in their life, local children with a migrant background tend to answer more positively than the other groups (Table 95). Regarding organized leisure activities, meeting with friends, using electronical devices to stay in contact with friends and relatives, and spending time just with oneself, there are no big differences associated with ethnicity (Table 96).

Regarding confidence in help from family and friends and having enough friends there is a significant association between local children with a migrant background and positive answers. Thus, they have more positive expectations of receiving help from family and friends when needed, and to a higher degree agree that they have enough friends. Local children without migrant background tend to estimate their parents or carers listening to them less positively than the other groups (Table 97).

A larger proportion of local children without migrant background report that they spend time with friends from school in their spare time (eight out of 10 compared to seven out of 10).

A lower proportion of migrant children respond that they spend time with other friends out of school, while a higher proportion (almost three out of 10) of migrant children report that they don't spend time with friends in their spare time. In this respect the local children with and without migration background report more similar patterns (Table 98). Regarding spending time with friends face to face, when not in school, children born abroad to a lesser degree than local children with or without migrant background report that they spend time with their friends face to face. The respondents born in Denmark but with immigrant background are the most likely to report that they 'often' spend time with friends face to face when not in school. The distribution of answers regarding online contact is more similar between groups (Table 99).

Table 93 - Ethnicity (recoded)

|  | F | \% |

## Ethnicity - School life

Regarding questions on well-being and feeling of safety, belonging and acceptance in school, the answers of local children with migrant background points towards a more widespread feeling of safety, belonging, feeling OK with the teacher asking questions, and with classmates' thinking of them, than the other two groups (Table 100).

Children born abroad to a higher degree report that their teachers accept them and listen to them, while the answers of local children with and without migrant background are more similarly distributed (Table 101).

Regarding being left out of games or activities, being made fun of, and being hit or hurt, a slightly larger proportion of respondents born in Denmark with migrant background report that they never had such experiences during the school year in which the survey took place (Table 102). When it comes to experiences of being treated unfairly by classmates or teachers, migrant children and local children with migrant background to a higher degree report of unfair treatment than children without migrant background. Especially religion, nationality/race, and where they live are reported as causes for unfair treatment. In all these categories, teachers are estimated to treat them unfairly slightly more than classmates. A larger proportion of children born in Denmark with migrant parents report unfair treatment because of their gender than in the two other groups (Table 103).

There is a significant association between being born in Denmark with both parents born abroad and not being allowed to speak other languages than Danish in the hallways of the school or during breaks. Almost four out of 10 report this, while it only goes for tree out of 10 of the migrant children and two out of 10 of the local children (Table 104). About one
third of the respondents in each category report that their teachers do not include other languages than Danish as a resource in the lessons. Among children born abroad 13\% report that it often happens, while $16 \%$ of children without migrant background and $18 \%$ of children born in Denmark with migrant background report that it often happens (Table 105).

A much larger proportion of respondents born in Denmark with migrant background (half of them) find that they are doing very good in school compared to their classmates. Thus, there is a significant association between having this background and experienced school success (Table 106).

Respondents born in Denmark with migrant background tend to answer most positively on the questions on children's rights to keep their customs and cultural expressions when coming from another country and that children from different backgrounds get along well in their class. Migrant children answer more positively that they like that there are students with different backgrounds (Table 107).

A larger proportion of respondents born in Denmark with migrant background (56\%) and migrant respondents (42\%) report having several friends from different countries. Only 16\% of respondents born in Denmark report this (Table 108).

## Citizenship - Well-being and everyday life

Regarding life satisfaction and positive feelings about the future respondents with and without citizenship tend to answer positively to the same degree. Respondents without citizenship express less positive answers to what they want in their life, while they to a higher degree report that they like being the way they are (Table 109).

Regarding organized leisure activities, using electronical devices to stay in contact with friends and relatives, and spending time just with oneself, there are no big differences associated with citizenship. A slightly larger proportion of respondents without citizenship (almost one fourth compared to about one tenth) report that they rarely or never meet and play when friends when they are not in school (Table 110).

Regarding confidence in help from family, being listened to by parents (carers) and having enough friends, respondents without citizenship respond less positively. Their answers are a little more positive regarding confidence in support of friends (Table 111).

A smaller proportion of respondents without citizenship report that they spend time with friends from school face to face and online in their spare time. Three out of 10 report that they don't spend time with friends in their spare time while this is the case for one out of 10 respondents with citizenship (Table 112).

Children with citizenship tend to spend more time with friends online (gaming, chatting, using Snapchat, Instagram or other social media) compared to those without citizenship (75 \% compared to $66.7 \%$ who chose the answers sometimes or often).

## Citizenship-School life

There are no big differences associated with citizenship regarding questions of wellbeing and feeling of safety, belonging and acceptance in school (Table 114). There are no big differences associated with citizenship and feeling accepted in school. A slightly larger proportion (three out of 10) of respondents without citizenship report that their teachers often talk about different countries, languages, cultures, and religions in school. Only two out of 10 with citizenship report that it happens often (Table 115).

There are no big differences regarding experiences of being made fun about during the school year in which the survey took place. A slightly larger proportions of the respondents without citizenship report that they have never experienced being hit or hurt while a slightly
smaller proportion report that they have never been left out of games or activities (Table 116).

In all questions of unfair treatment, respondents without citizenship feel that they have been treated unfairly by classmates and teachers to a higher degree than respondents with citizenship. Especially regarding religion, nationality/race, the place they live and the language they speak unfair treatment is experienced by about one fifth of the respondents without citizenship (Table 117).

The respondents with and without citizenship do almost not differ in their experience of not being allowed to speak other languages than Danish in the hallways of the school or during breaks (Table 118). Slightly more respondents without citizenship report experiencing that teachers often or sometimes include other languages than Danish as a resource in the lessons (Table 119).

While one third of respondents with citizenship report that they do better than average in school, only one fifth of respondents without citizenship share this experience. Thus, respondents without citizenship tend to estimate their school performance lower than respondents with citizenship (Table 120).

For all questions on acknowledgment of newcomers' right to follow customs and keep cultural expressions, diversity in class and getting along with each other, it appears that there is a slightly lower degree of positive attitudes among respondents without citizenship (Table 121).

A larger proportion (four out of 10) respondents without citizenship report that they have several friends from different countries, while only two out of 10 respondents with citizenship report that (Table 122).

## Religion - Well-being and everyday life

Religion was recoded into four groups: Christianity; Islam; Hindusim, Buddhism, Sikhism, Judaism and other and not affiliated with religion. Since the group "Hinduism, Buddhism, Sikhism, Judaism, Other" has a small number of cases its explanatory power is low. Nevertheless, it is shown in tables.

Children affiliated with Islam tend to be more satisfied with their lives (average 4.5) compared to those not affiliated with religion (4.17). They also more express that they like being the way they are (4.43) compared to those who are not affiliated with religion (3.91) and children belonging to Christianity (4.04). Additionally, they also feel more positive about their future (4.39) compared to children not affiliated with religion (3.98) (Table 125).

Regarding organized leisure activities, meeting with friends, using electronical devices to stay in contact with friends and relatives, and spending time spending with friends there are not significant differences among different affiliations to religion. Compared to other children, those affiliated with Islam spend less time alone (14.4\% everyday compared to more than $30 \%$ for other groups) (Table 126)

Children affiliated with a religion tend to agree more that family helps them when in need compared to those not affiliated with any religion. There is a significant difference between children affiliated with Islam and those not affiliated with any religion (Table 127).

Children affiliated with Christianity spend more time with friends out of school than other children. A larger proportion of respondents affiliated with Christianity report spending time with friends face to face, while a slightly larger proportion of respondents not affiliated with a religion report that they don't spend time with friends in their spare time (Table 128 and 129).

## Religion - School life

A larger proportion of respondents affiliated with Islam that they often like being in school, feel safe in school, feel that they belong in school, and feel OK when the teacher asks them a question. Regarding feeling OK about what the classmates think about them, the distribution of responses differs less between the groups (Table 130).

While a majority of children feel accepted in school by their classmates, children affiliated with Islam feel slightly less accepted compared to children of other religions ( $6.6 \%$ say they never or rarely feel accepted and $85.5 \%$ often or almost always feel accepted compared to $3.3 \%$ and $90.6 \%$ of children affiliated with Christianity and $0 \%$ and $91.8 \%$ of children not affiliated with religion). Similarly, while they feel accepted by their teachers, the share is slightly lower compared to other groups of children ( $86.5 \%$ compared to $92.4 \%$ of children affiliated with Christianity and $90.3 \%$ of children not affiliated with religion). Those who are not affiliated with religion slightly less agree that teachers listen to them and take into account what they say (Table 131).

There are no big differences associated with religious affiliation regarding being left out of games or activities, being made fun of or called names. A slightly bigger proportion of those who are not affiliated with a religion said they were never hit or hurt or left out of activities (Table 132).

Respondents with religious affiliation to Islam and Hinduism, Buddhism etc. report having experienced unfair treatment to a larger degree than other religious affiliations regarding their nationality/race, where the live and their language. In the study sample, respondents' affiliation with religion was significantly moderately and positively associated with feelings of discrimination by teachers because of nationality/race. A larger proportion of respondents affiliated with Islam (22.1\%) reported feelings of discrimination by teachers due to nationality than respondents affiliated with Christianity (2\%) or not feeling affiliated with any religion (4\%). Also, a larger proportion of respondents affiliated with Islam (18\%) felt treated unfairly by their teachers because of the place they live. Similarly, a larger proportion of respondents affiliated with Islam and those affiliated with Hinduism, Buddhism and other religions reported being treated differently by their classmates, because of their religion, nationality and the language they speak compared to those affiliated with Christianity or not feeling affiliated with any religion (weak associations) (Table 133).

Being affiliated with Islam or Hinduism, Buddhism and other religions is associated with responding that children are not allowed to speak other languages in school. Almost four out of 10 report this, while in the other two groups two out of 10 report that there is such a policy in their school (Table 134).

There are no big differences associated with religion regarding experiencing that teachers do not include other languages than Danish as a resource in the lessons. However, a slightly larger proportion of respondents not affiliated with a religion report that their teachers often do that (Table 135).

When it comes to respondents' estimation of how well they do in school, almost four out of 10 respondents either affiliated with Islam, Hinduism, Buddhism et al. or not affiliated with a religion, report that they do better than the average in their class. This only goes for almost three out of 10 respondents associated with Christianity (Table 136).

According to Table 137, respondents affiliated with Islam to a higher degree than those affiliated with Christianity or other religions tend to having a positive approach to migrants and linguistic, cultural, and religious diversity in society and school.

While more than half of the respondents affiliated with Islam and other religions report having several friends from other countries, cultural, religious or linguistic backgrounds, this only goes for less than one fifth of respondents not affiliated with a religion and affiliated with Islam (Table 138).

## Socio-economic status - Well-being and everyday life

Since there were only 31 answering that they had less things (for example, toys, clothes, computer) than the others in class, which was meant to point to difficulties to cover economic necessities, the numbers to make relevant analyses is too small and the variable was recorded in a way that the answers of those who have about the same things and of those who have less things were merged for further analyses. In the analyses, no difficulties point to respondents reporting that they have more things than others and some or a lot of difficulties point to respondents having the same or less things than others.

Regarding life satisfaction, having what they want in their life, being the way they are, and positive feelings about the future, respondents with more material goods tend to answer more positively (Table 140).

In relation to organized leisure activities, meeting with friends, using electronical devices to stay in contact with friends and relatives, and spending time just with oneself, there are no big differences associated with socio-economic status (Table 141).

Regarding confidence in help from family and feeling listened to by carers there are no differences associated with material goods. Respondents experiencing having the same or less goods than others tend to respond more positively on having enough friends while they answer a little less positively regarding confidence in support from friends (Table 142)

There are no big differences associated with material goods regarding spending time with friends face to face or online, or not spending time with friends (Table 143).

Regarding patterns of social interaction with friends (face to face or online) in leisure time are no big differences associated with material goods (Table 144).

## Socio-economic status - School life

There are generally no big differences associated with material goods regarding the experience of being in school and feelings of safety and belonging in class. Respondents with more material goods tend to answer a little more positively on feeling OK when a teachers asks a question and about what their classmates think of them (Table 145).

There are generally no big differences associated with material goods regarding the experience of being in school and feelings of safety and belonging in class. Respondents with more material goods tend to answer a little more positively on feeling accepted and listened to by their teachers (Table 146).

Regarding being left out of games or activities, being made fun of, and being hit or hurt, a slightly larger proportion of respondents having the same or less material goods than the average report that they never had such experiences during the school year in which the survey took place (Table 147).

There are no big differences to be associated with material goods regarding experienced unfair treatment due to economic status and language. A larger proportion of respondents having more material goods than the average report being treated unfairly because of their gender, especially by classmates ( $15 \%$ ) and because of compared to $7 \%$ ) the place they live, especially by teachers ( $14 \%$ compared to $7 \%$ ), and religion, especially by teachers ( $11 \%$ compared to 5\%) and language (10 \% compared to 5\%). (Table 148)

A larger proportion of respondents (78\%) having the same or less material goods than the average report experiencing that they were not allowed to speak other languages than Danish in the hallways of the school or during breaks. compared with respondents having more material goods than the average (66\%) (Table 149).

There are no big differences between respondents with more material goods and respondents with average or less material goods regarding experiencing that teachers do not include other languages than Danish as a resource in the lessons (Table 150).

A larger proportion of respondents with more material goods (almost four out of 10) find that they are very good in school compared to classmates, while almost three out of 10 respondents with average or less material goods report that they do better than the average in school (Table 151).

While respondents with more material goods than others tend to have a positive approach being in a class with students with different backgrounds. respondents with average or less material goods tend to have a positive experience of children with different backgrounds getting along well in class. Regarding the attitude towards migrant children's right to keep their customs and cultural expressions there is no difference to be associated with socio-economic status (Table 152).

One third of respondents with more material goods than others report having several friends from other countries, while half of those respondents report having a few friends from other countries. Only about one fifth of respondents with average or less goods report having several friends from other countries. while $65 \%$ report that they have a few (Table 153).

## 4. Conclusions and discussions

The children in our study express high level of life satisfaction and family support. Nevertheless, older children reporting less positive feelings regarding life satisfaction, having what they want in their life, being who they are, and the future. There exist differences in terms of experiences of help, support and listening from family across the age groups. A lower proportion of older respondents feel that their parents or caregivers listen to them and that their family is willing to help them. In terms of gender, boys report a higher degree of satisfaction with their lives, and with being the way they are, while girls report a higher degree of feeling positive about their future. Boys to a lesser degree tend to feel that their parents or carers listen to them, and that if they have a problem, a friend will help.

In relation to ethnic background, local children with a migrant background tend to answer more positively than the other groups that they are satisfied with their lives, have positive feelings about the future and have what they want in life. This group of children also has more positive expectations of receiving help from family and friends when needed, and to a higher degree agree that they have enough friends. Local children without migrant background tend to estimate their parents or carers listening to them less positively than the other groups. Respondents without citizenship also express less positive answers to what they want in their life, while they to a higher degree report that they like being the way they are. Regarding confidence in help from family, being listened to by parents (carers) and having enough friends, respondents without citizenship respond less positively. Their answers are a little more positive regarding confidence in support of friends. Children affiliated with Islam tend to be more satisfied with their lives compared to those not affiliated with religion. Generally, children affiliated with a religion, and particularly Islam, tend to agree more that family helps them when in need compared to those not affiliated with any religion.

Almost one third of respondents indicate that they never or rarely participate in organised recreational activities. While this might be attributed to COVID-19 lockdowns, there exist differences according to age and gender as in the younger group, a larger proportion say they participate in organised leisure activities. Also, more boys than girls participate in organised leisure activities, while there were no big differences associated with ethnicity.

Regardless of age children rather often spend time with friends when they are not in school. Both face to face contacts and online communication are frequent. The older respondents are more likely to use smartphones or other devices to keep in touch with friends and relatives than the younger ones. Older children also more frequently spend time just being with themselves almost every day. More boys than girls report meeting friends every day or almost every day. However, the proportion of boys reporting that they rarely or never spend time with friends are slightly larger than for girls. In terms of ethnic background, migrant children spend less time with friends in their spare time. They less frequently spend time with their friends face to face. On the other hand, local children without migrant background spend more time with friends from school in their free time. A slightly larger proportion of respondents without citizenship report that they rarely or never meet and play
when friends when they are not in school. They also less frequently report that they spend time with friends from school face to face and online in their spare time. Children with citizenship tend to spend more time with friends online (gaming, chatting, using Snapchat, Instagram or other social media) compared to those without citizenship. In terms of religion, children affiliated with Christianity spend more time with friends out of school than other children. Regarding life satisfaction, having what they want in their life, being the way they are, and positive feelings about the future, respondents with more material goods tend to answer more positively.

Children generally report feeling well and safe at school, they feel they belong to school and feel comfortable at school. They also feel that their teachers and classmates listen to them and care about them. In general, the younger group seems more often to like being in school, and they are more likely to feel safe, to feel that they belong in the class, and to feel comfortable when asked questions by their teachers and with what their classmates think about them. In relation to ethnicity, children with migrant background more often express feelings of safety, belonging, feeling OK with the teacher asking questions, and with classmates' thinking of them, than the other two groups. Children born abroad to a higher degree report that their teachers accept them and listen to them. A larger proportion of respondents affiliated with Islam that they often like being in school, feel safe in school, feel that they belong in school, and feel OK when the teacher asks them a question. While children generally feel accepted in school by their classmates, children affiliated with Islam feel slightly less accepted compared to children belonging to other religions.

The majority of children do not experience violence in school. Nevertheless, about one third experienced psychological violence or exclusion and about one quarter physical violence. A larger proportion of the older group report that they have never experienced bullying, violence and exclusion in this school year. Boys experienced more physical violence and less psychological violence compared to girls. Only a small share of respondents (less than 10\%) feel they have been treated unfairly by classmates or teachers. Gender and place of residence are the most common reasons for unfair treatment, while unfair treatment based on economic status is the least common. A greater proportion of boys say they feel discriminated against because of their gender. In addition, a larger proportion of boys feel unfairly treated by teachers on grounds of their religion and where they live. When it comes to experiences of being treated unfairly by classmates or teachers, migrant children and local children with migrant background to a higher degree report of unfair treatment than children without migrant background. Especially religion, nationality/race, and where they live are reported as causes for unfair treatment. In all these categories, teachers are estimated to treat them unfairly slightly more than classmates. In all questions of unfair treatment, respondents without citizenship feel that they have been treated unfairly by classmates and teachers to a higher degree than respondents with citizenship. Especially regarding religion, nationality/race, the place they live and the language they speak. Also In the study sample, respondents' affiliation with religion was significantly moderately and positively associated with feelings of discrimination by teachers because of nationality/race. A larger proportion of respondents affiliated with Islam and those affiliated with Hinduism, Buddhism and other religions reported being treated differently by their
classmates, because of their religion, nationality and the language they speak compared to those affiliated with Christianity or not feeling affiliated with any religion.

Only a small proportion of children report that their teachers talk about different countries, languages, cultures and religions at school. A quarter of respondents report that they were not allowed to speak any language other than Danish in the school corridors or during breaks and one third say that teachers do not include languages other than Danish as a resource in the lessons. There is a significant association between being born in Denmark with both parents born abroad and not being allowed to speak other languages than Danish in the hallways of the school or during breaks.

Generally, children have positive attitudes towards migrants and towards linguistic, cultural and religious diversity in society and school, girls and respondents born in Denmark with migrant background expressing higher degree of more positive attitudes. For all questions on acknowledgment of newcomers' right to follow customs and keep cultural expressions, diversity in class and getting along with each other, it appears that there is a slightly lower degree of positive attitudes among respondents without citizenship. In terms of religion, respondents affiliated with Islam to a higher degree than those affiliated with Christianity or other religions tend to have a positive approach to migrants and linguistic, cultural, and religious diversity in society and school. Most of children also have friends from other countries. Nevertheless, a larger proportion of respondents born in Denmark with migrant background and migrant respondents as well as respondents affiliated with Islam report having several friends from different countries. Respondents with more material goods than others to a higher degree report having several friends from other countries.

A much larger proportion of respondents born in Denmark with migrant background (half of them) find that they are doing very good in school compared to their classmates. Thus, there is a significant association between having this background and experienced school success. A larger proportion of respondents with more material goods report that they are doing very good in school compared to classmates.

Comparison of newly arrived and long-term migrant children with local children shows that they are all generally satisfied with their lives and have positive views on the future. Migrant children are generally more satisfied with the way they are, while local children tend to agree more with what they have in their lives.

Patterns of social contact, particularly spending time with friends as one of the most important factors of integration do not differ significantly across groups, however more migrant children compared to local say they do not spend time with friends in their free time. This is particularly true for face to face contacts. Migrant children are also less likely to agree that they have enough friends, even if they generally agree more often that in need they have a friend who would support them. They also more rarely spend time alone compared to migrant children.

All groups of children generally perceive schools as safe environment, where they feel comfortable and welcomed by both, teachers and classmates. A larger proportion of respondents with a migrant background say that they often feel accepted by their teachers and listened to.

While there were no big differences in relation to peer violence among the groups, respondents with a migration background state to a greater extent that they feel treated unfairly by teachers and fellow pupils than local respondents. They more often state that they were treated unfairly by their classmates because of their gender, economic status and language and by their teachers because of their religion, nationality and the district they live in.

One fifth of the local respondents and one third of the newly arrived and long-term migrant respondents state that children are not allowed to speak other languages than Danish when they are at school during breaks, in the corridors and when playing. They also say that their teachers do not use languages other than Danish during classes.

A slightly larger proportion of migrant respondents feel that they are less successful than their classmates.

With regard to interculturality, newly arrived and long-term migrant children express more positive views towards migrant children right to follow the customs of their countries of origin and also view diversity in the classroom somewhat more positively. A large majority in both groups report they have friends from other countries, but more migrant respondents report that they have several.

## SLOVENIA

Zorana Medarić

## 1. Introduction

The report presents the research results of a survey conducted in seven schools across Slovenia, three primary and four secondary schools. The aim was to explore their well-being in everyday lives and relations in schools and attitudes as well as opinions related to multiculturality, cultural and religious diversity, migration etc. First, the descriptive results for the whole population are presented, followed by a more detailed presentation of results for the three groups of children central to the MiCreate project: newly arrived children who migrated to Slovenia less than three years ago, long-term children who migrated to Slovenia more than three years ago, and local children without migration experience.

Finally, also results according to demographic variables: age, gender, ethnicity, religion, citizenship, socio-economic status are presented. In the final section of the report main conclusions are presented.

## 2. Methodological approach

The survey was implemented between September 2020 and January 2021 in 3 primary and 4 secondary schools. Students from the age group between 10 and 17 (though some were older) were invited to participate in research. The classes were mostly selected with assistance of the contact person in school - often the teacher, school principal or school counsellor. In each school one researcher coordinated the implementation of the survey, a total of six researchers were involved in the survey. The consent signed by all students and their parents was gained by the contact person at the beginning of the research for both, quantitative and qualitative research. Students were also informed of their voluntary participation in the research by the researcher in the class. A total of 712 students participated in the survey. The survey was implemented CAWI either in computer class or over smartphones with a presence of researcher or in the period of lockdown, the links were sent to pupils via email and the survey was completed during one of the classes without the presence of researcher. Questionnaires were translated to different languages: Bosnian, Macedonian, Albanian and English. Staff facilitated the implementation of research in different ways, for example, by making agreements with teachers and arranging schedules, additionally explaining the relevance of the study, by forwarding instructions, project's aim and link to the survey to pupils via e-mail etc. When present in classes, researchers explained the overall aim and objectives of the survey and helped with the interpretation of the questions when needed; additionally, they tried to motivate students for participation. The major difficulties encountered were related to school closure due to COVID - 19 that prevented the surveying in classrooms in some schools. Consequently, the researcher established online communication with the teacher and school counsellor and provide them with instructions. In relation to the research implemented in schools, some students had difficulties with web connection or did not have smartphone. Researcher lent their own smartphones or created a personal hotspot.

## 3. Results

What follows is the presentation of main findings from the quantitative research in Slovenian primary and secondary schools.

### 3.1 Sample population

## Demographic data

In this section a description of the data by demographic characteristics is presented. The majority of respondents in our study were children aged between 14 and 20 years ( $72.5 \%$ ), i.e. secondary school students (Table 1). The gender ratio was balanced: $52 \%$ were girls and $48 \%$ boys (Table 3). The group included $6.6 \%$ newly arrived children - i.e. those who have been in Slovenia for three or less years, $10.2 \%$ long-term children - who migrated to Slovenia more than three years ago, and $83.2 \%$ local children who have no migration experience (Table 10). Most migrant children come mainly from Bosnia and Herzegovina
(47.9\%), Kosovo (7.7\%) and Serbia (7.7\%) (Table 9). In terms of ethnicity, where multiple answers were possible, $74.9 \%$ of the children reported being Slovenian and 36.4\% belonging to one of the ethnic groups of the former Yugoslavia ( $13 \%$ Bosnian, $8.2 \%$ Serb, 5.5\% Croat, 5.2\%, Albanian, 3.1\% Macedonian, 1.4\% Montenegrin), 2\% Italian, 0.3\% Roma $0.4 \%$ and other $5.9 \%$ (including Russian $0.7 \%$ and Ukrainian 0.5\%) (Table 5). 87.8\% of children speak one language at home, while $11.4 \%$ are bilingual or speak several languages at home (Table 6). Almost all children reported that they speak the Slovenian language well or very well (Table 6). Most of the children also reported having Slovenian citizenship (Table 11). One third of the children stated that they had at least one parent who was born in another country (Table 14).

About one third of the children stated that they did not belong to any religion, one fifth of the children declared to be Roman Catholic (21.4\%), while 18.8\% did not want to answer or did not know, 17.4\% declared to be Muslim and 8.9\% Orthodox (Table 15).

Slightly more than a third of the children live in a big city, slightly less than one- third live in a city or small town, and one- third live in a rural village (Table 16). 45.9\% of the children consider their neighbourhood to be culturally diverse (Table 17). The majority of children, $79.7 \%$, like to live in Slovenia, $12.7 \%$ were undecided in this respect and those who do not like to live in Slovenia most often mentioned the USA, the UK, Germany, Spain, France, Austria, Switzerland and Canada (Tables 18 and 19). The vast majority live with their family members (98.6\%) (Table 21).

In terms of socio-economic status, most children indicated that they have a medium socio-economic status and that they generally own about as many material things as their classmates. A minority reported owning fewer (5\%) or more material things (12.3\%) than their classmates (Table 20).

## Well-being and everyday life

Respondents chose answers on a scale from 1-strongly disagree to 5-strongly agree. The majority of children are satisfied with their lives ( $80 \%$ ), feel that they have what they want in life (70.4\%), like being who they are (66.2\%), are positive about their future (80.1\%) and feel that there are people around them who are willing to help them when they are in need ( $81.4 \%$ ) (Table 22 ). The lowest levels of satisfaction is related to the self - perception (I like being the way I am ), where $13.6 \%$ of children disagree or strongly disagree with the statement and with having what they want in life, where $11.4 \%$ of children disagree or strongly disagree.

The majority of children at least once a week or more often keep in touch with friends/relatives through smartphone or computer ( $94.7 \%$ ), meet and play with friends ( $86.3 \%$ ), spend time with themselves ( $68.4 \%$ ) or participate in organised leisure activities or courses outside school (music, sports, dancing, languages, scouts, etc.) (40.8\%) (Table 23).

Regarding family and friends, $91.2 \%$ of respondents agree or strongly agree that there is someone in their family who helps them when they have a problem. 79.3\% agree or strongly agree that their parents listen to them and take into account what they say. 85.7 feel that they have enough friends and 91.8 feel that they have a friend who supports them when they have a problem (Table 24).

Outside of school, $67.6 \%$ of children spend time with other friends (e.g. from the neighbourhood), $54.2 \%$ spend time with friends from school and $23.1 \%$ spend no time with friends (Table 25). 88.1\% of children occasionally, sometimes or often spend time with friends face to face, while $85.3 \%$ spend time with friends online.

## School life

The majority of children occasionally (29.9\%), sometimes (31.4\%) or often (18.5\%) enjoy being at school and 90.5\% occasionally (12.2\%), sometimes (28.9\%) or often (49.4\%) feel safe when they are at school. They occasionally or often feel like they belong in their class (89.4\%), they are OK when a teacher asks them a question (75.7\%) and they feel okay about what their classmates think of them (87.3\%) (Table 27).

In relation to their classmates, $93.3 \%$ feel accepted by them occasionally, sometimes or often and $87.3 \%$ think that their classmates care about their feelings. In relation to teachers, $91.2 \%$ feel that their teachers accept them for who they are. Less so, $72.2 \%$ say that
teachers at least occasionally talk about other countries, languages, cultures or religions (Table 28).

Regarding violence, $42.5 \%$ of children have experienced psychological violence in the form of taunting, name-calling, spreading lies and the like in the last year, $12.3 \%$ more than three times, $18.4 \%$ of children have experienced physical violence and $3.7 \%$ more than three times, and $36 \%$ of children have been excluded from other children's activities (Table 29).

Sometimes children felt discriminated against by their teachers because of their gender (14.9\%), economic status (5.5\%), religion (5.3\%), ethnicity/culture (7.7\%), where they live ( $5.1 \%$ ) or the language they speak ( $8.4 \%$ ). They also felt they were treated differently by their classmates. Compared to teachers, this happened to a lesser extent because of their gender ( $8.4 \%$ ), but the figures were higher for feeling treated differently because of their economic status (9.7\%), religion (9.7\%), ethnicity (8.9), where they live (7.9\%) and the language they speak (9.1\%) (Table 30).

The majority of children (88.4\%) say they are allowed to speak other languages at school and $51 \%$ say teachers sometimes use other languages in class (Tables 31 and 32).

Regarding academic achievement, more than half of the students (53.8\%) think they do averagely well in school and $43.4 \%$ think they do well. Only a few pupils think that they are not successful at school (2.8\%) (Table 33).

The children who participated in the survey generally have a positive attitude towards multiculturality. They stress the importance of preserving their own culture ( $72.9 \%$ ) as well as like multiculturality in their class and school (77.6\%). They also have friends from other cultures (87\%) (Tables 34 and 35).

3.2 Newly arrived, long-term and local children

## Demographic data

The children in our sample were divided into three groups: newly arrived children who migrated to Slovenia less than three years ago, long-term children who migrated to Slovenia more than three years ago, and local children without migration experience. The sample consisted of more children in the 14-20 age group, especially among the local children (75.6\%) and more girls than boys, particularly among newly arrived migrant children (63.8\%) (Table 36 and Table 37).

In terms of ethnic background, among migrant children, children from the republics of the former Yugoslavia predominate. There where multiple answers possible and 44.7\% newly arrived children chose Bosnian ethnicity, 23.4\% Serbian, 10.6\% other (Chinese, Russian, Ukrainian), 8.5\% Albanian and 8.5\% Macedonian. Among long-term children $40.4 \%$ chose Bosnian ethnicity and as many as $20.8 \%$ chose Slovenian ethnicity, 19.4\% Albanian, other (Greek, Chinese, German, Romanian, Russian, Slovak, Ukrainian) 13.9\% Serbian and 11.1\% Macedonian. 87.4\% of local children chose Slovenian ethnicity, 8.5\% Bosnian, 6.3\% Serbian and 6\% Croatian (Table 38).

In relation to languages spoken at home, $36.2 \%$ of newly arrived migrant children speak Bosnian, $23.4 \%$ Serbian and $6.4 \%$ Macedonian language. Among long-term migrant children most spoken languages are Bosnian ( $26.4 \%$, Slovenian $13.9 \%$, Albanian $11.1 \%$ and Serbian $11.1 \%$ ). Majority of local children ( $81.2 \%$ ) speak Slovenian language at home, followed by Bosnian (3.2\%) or both, Slovenian and Bosnian (2.4\%) (Tables 39, 40 and 41).

As expected, only $29.8 \%$ of the newly arrived migrant children, $70.8 \%$ of long-term migrant children and $85.2 \%$ of local children stated that they spoke the Slovenian language very well (Table 42). More than half of newly arrived migrant children were born in Bosnia and Herzegovina, $10.6 \%$ in Serbia, $8.5 \%$ in Northern Macedonia, $6.4 \%$ in Kosovo, $4.3 \%$ in Russia and $4.3 \%$ in Croatia. Among long-term migrant children, $41.7 \%$ were born in Bosnia and Herzegovina, 16.7\% in Kosovo, 9.7\% in Austria, 8.7\% in Northern Macedonia, 5.6\% in Serbia, while less than $3 \%$ were born in Ukraine, Russia, Croatia, India, China, Hungary and Switzerland (Table 44). The majority, namely 96.3\% of local children, 36.6\% of long-term migrant children and none of the newly arrived migrant children have Slovenian citizenship (Table 45). Three quarters (74.5\%) of newly arrived migrant children, $67.6 \%$ of long-term migrant children and $27.5 \%$ of local children have parents born abroad (Table 46).

More than half of newly arrived (53.2\%) and long-term (54.9\%) migrant children and $9.8 \%$ of local children feel they belong to Islam. About one third of the newly arrived (29.8\%), 19.7\% of the long-term children and $5.9 \%$ of the local children feel they belong to the Orthodox religion and none of the newly arrived, $2.8 \%$ of the long-term and $25.6 \%$ of the local children affiliated with Roman Catholic religion. In addition, $6.4 \%$ of the newly arrived, $18.4 \%$ of the long-term and $36.2 \%$ of the local children did not feel they belonged to any religion (Table 47).

More local children lived in a rural area or village than newly arrived children and longterm children (Table 46). Newly arrived migrant children are more likely (78.7\%) to report living in a multicultural area compared to long-term (52.8) and local children (42.3) (Table 47). Both newly arrived and long-term children were slightly more likely than local children to say that they liked living in Slovenia (Table 48).

Regardless of their status, most children assessed their socio-economic status as similar to other children and owned about the same amount of material things as their classmates (Table 49). Among newly arrived migrant children, there were $4.3 \%$ and among newly arrived migrant children $1.4 \%$ who did not live with the members of their family (Table 55).

Table 54 - Migrant Status * Socio-economic status

Figure 54.1

Table 55 - Migrant Status × Do you live with the members of your family?

## Well-being and everyday life

In terms of their well-being, newly arrived children and long-term children on average express similar levels of satisfaction with life (slightly above 4), agreement that they have what they want in life (slightly below 4) and a positive feeling about their future (slightly above 4). On average, newly arrived children express higher levels of agreement with being the way they are (average 4.32) compared to long-term (3.94) and local children (3.87). Newly arrived migrant children are also slightly less likely to agree (3.89) than long-term migrant children (4.13) and local children (4.19) that they have support from local people if they need it (Table 56).

When not at school, newly arrived migrant children are less likely to participate in organised leisure activities, meet and play with friends and spend time alone compared to the other two groups, while local children are slightly more likely to meet and play with friends. The differences are not statistically significant (Table 57).

In terms of friends and family, newly arrived children are generally more likely to feel that they are supported by their family ( 4.83 newly arrived compared to 4.51 long- term and 4.59 local) and especially by their parents ( 4.59 newly arrived compared to 3.9 long-term and 4.15 local). All three groups feel that they have enough friends and are supported by a friend when needed (Table 58). Newly arrived migrant children spend less time with friends from school compared to the other two groups, and local children spend statistically significantly more time with other friends ( $70.3 \%$ compared to $52.9 \%$ and $54.3 \%$ ). Newly arrived migrant children spend less time with friends face-to-face (Table 59).

Figure 60.1

School life

In relation to school life, newly arrived migrant children more often express they enjoy being at school than long - term migrant or local children. They also less frequently express they feel safe when they are at school. The differences are statistically significant. (Table 61) In terms of relationships with other pupils, the majority of all three groups (more than three quarters) sometimes or often feel that they belong to their class and occasionally or often feel comfortable with their classmates' opinions about them, they also feel ok when addressed by teachers. All three groups feel accepted by their classmates and generally feel that their teachers listen to them. However, there were slightly more local children who felt that they were rarely listened to. Compared to the other two groups, newly arrived migrant children were more likely to report that their teachers talk about different cultures, religions, etc. $69.5 \%$ compared to $45.6 \%$ for long-term migrant children and $42.9 \%$ of local children (significant differences) (Table 62).

There were no statistically significant differences in the experience of different types of violence between the three groups of children, however, the percentage of children who never experienced physical violence, psychological violence or shunning was always highest among the local children (Table 63).

Regarding discriminatory treatment based on various factors, both newly arrived and long-term migrant children are more likely than local children to report that they have been treated unequally because of their religion, ethnicity/culture and the language they speak by both, teachers and classmates(statistically significant differences) (Table 64). There are no significant differences between the three groups in terms of self-perceived school success. The majority of all groups also feel that children are allowed to speak other languages in their school and that teachers sometimes speak to children in other languages, with newly arrived children and long-term migrant children more likely to feel that this happens often or sometimes than local children (Table 65 and Table 66).

Migrant children, both newly arrived and long-term migrants, are more positive about multiculturality. On average, they are more likely to agree that migrants should maintain their customs and culture (average 4.37 and 4.41 compared to 3.98 ) and that they like multiculturality in their class and school (average 4.44 and 4.36 compared to 4.02 ). Newly arrived migrant children slightly more agree that students of different ethnicities get along well in their class (Table 68). Newly arrived children and long-term term migrant children also have more friends from different countries (Table 69).

### 3.3 Analyses according to demographic variables

In this section the attitudes of children/youth were analysed according to various demographic variables. This section will be the basis for the crosscutting analysis.

## Age - Well-being and everyday life

Younger children are generally more satisfied with their lives, with having what they want in life, with their self-perception and their views about their future. These differences are statistically relevant (Table 70). Younger children are also more likely to participate in organised activities outside school $-66.8 \%$ participate in such activities at least once a week, compared to $31 \%$ of older children. They also spend more often spend time meeting and playing with friends. On the other hand, older children are more likely to use smartphones or computers to keep in touch with relatives and friends $-80.7 \%$ of older children use them daily or almost daily, compared to $69.1 \%$ of younger children. They are also more likely to spend time just being by themselves ( $36.1 \%$ of older children compared to $24.6 \%$ of younger children) (Table 71).

Younger children feel more supported by their family and friends. Compared to older children, they are more likely on average to say that their family helps them when they have a problem (average 4.79 compared to 4.52 ) and that their parents listen to them and take into account what they say (average 4.35 compared to 4.07 ). They are also more likely, on average, to feel that they have enough friends ( 4.46 vs .4 .31 ) and that they are supported by their friends when they have a problem (4.70 vs. 4.52) (Table 72).

As expected, older children spend more time with other friends, such as friends from the neighbourhood, when they are not at school ( $71.3 \%$ ), compared to the younger group of children (57.8\%) (Table 73). Older children also spend more time with their friends online (55.8\%) compared to the younger group (often - 37.1\%) (Table 74 and Table 75).

## Age - School life

With regard to school and school life, there are significant differences in their views on school life. Younger children are more likely to say that they enjoy being at school (often $32.3 \%$ vs. $13.3 \%$ ), feel safe at school (often $-61.6 \%$ vs. $44.8 \%$ ), feel like they belong to the class (often-59.3\% vs. 42.7\%), are OK when a teacher asks them a question (often - 36.4\% vs. $14.4 \%$ ) and feel OK what their classmates think of them (often-40.3\% vs. 30\%) (Table 75). Compared to older children, they also feel accepted by teachers (often $-69.2 \%$ vs. 49.9\%) and feel that their teachers listen to them and take into account what they say (often $-47.3 \%$ vs. $26.5 \%)$. They are also more likely to say that teachers talk about intercultural issues at school (often-23.6\% vs. 12.8\%) (Table 76).

Younger pupils are more likely than older children to have experienced various forms of violence, such as psychological violence (at least once $56.7 \%$ vs. $37.2 \%$ ), physical violence
(at least once $34.8 \%$ vs. 12\%) or being excluded from activities (at least once 49.7\% vs. 44.9\%) (Table 77).

There is a difference between the two groups in terms of being treated differently by both teachers and classmates because of their gender. Younger children are more likely to feel they have been treated unequally by their classmates, while older children feel they have been treated differently by their teachers. They did not feel that they were treated differently because of other variables such as economic status, religion, ethnicity, district of residence and language (Table 78).

Both groups agree that children are allowed to speak different languages in their school, with the percentage being slightly higher among older children. However, younger children are more likely to say that teachers sometimes speak to children in other languages during lessons or ask them how certain things are said in other languages (Table 79 and Table 80).

Younger children also rate their academic performance better compared to older children. For example, $68.2 \%$ of younger children and $34 \%$ of older children say they do very well in school and their grades are good (Table 81).

Younger people are more positive about multiculturality. They are more likely to agree that they have the right to follow their country's customs when they move to another country and like multiculturality in their class and school more. They are3also slightly more likely to agree that intercultural relations in their class are good (Table 82). Both groups have friends from different cultures (Table 83).

## Gender - Well-being and everyday life

Boys generally report higher levels of well-being, especially in life satisfaction (mean 4.30 vs. 4.01 ) and positive self-perception (mean 4.04 vs . 3.64), where the differences are statistically different. Boys also value higher having what they want in life and having someone around them to turn to in their local areas when they are in need. Girls, on the other hand, are somewhat more positive about their future (Table 84).

In terms of activities, boys spend more time meeting and playing with friends (57.2\% (almost) every day) than girls (34.6\% (almost) every day). A higher percentage of girls also spend time just being by themselves (but without a significant difference) (Table 85).

Girls more often feel they have a supportive friend (mean score 4.62) than boys (mean score 4.51). However, they spend less time outside school with friends from school ( $51.9 \%$ girls and $56.8 \%$ boys) and other friends ( $64.3 \%$ girls and $71.3 \%$ boys). There are no gender differences in the amount of time they spend in person or online, occasionally or more often they all spend time with friends (Table 86, Table 87 \& Table 88).

## Gender - School life

In relation to school, there are no significant gender differences when it comes to liking being in school, feeling safe at school and belonging to the class. However, fewer girls ( $26.5 \%$ ) are OK when a teacher asks them a question compared to $21.9 \%$ of boys. They are also less likely to feel OK with their classmates' opinion of them - 16.8\% of girls never or rarely agree, compared to $8.4 \%$ of boys (Table 89).

There are also no gender differences in the perception of being accepted by teachers and that classmates care about their feelings. However, more boys ( $87.7 \%$ sometimes or often) than girls ( $80.7 \%$ sometimes or often) feel that their classmates accept them as they are, but more girls ( $71.7 \%$ sometimes or often) than boys ( $60.8 \%$ sometimes or often) feel that teachers listen to them and take into account what they say. There are also gender differences in perceptions of multicultural teaching, with more girls (49.7\% sometimes or often) than boys ( $39.8 \%$ sometimes or often) saying that their teachers talk about different countries, languages, cultures, or religions (Table 90).

No gender differences were found in relation to psychological violence, but more boys ( $23.2 \%$ ) than girls ( $13.9 \%$ at least once) experienced physical violence, while more girls ( $41.6 \%$ at least once) than boys (29.8\% at least once) experienced being excluded from games or activities (Table 91).

Boys (18\%) more often than girls (11.9\%) state they were treated differently by their teachers because of their gender, while girls (11.9\%) more often than boys ( $4.5 \%$ ) perceive they were treated differently by their classmates because of their gender. No gender differences were found in terms of socio-economic status, ethnicity/culture, neighbourhood, or language, but girls (11.6\%) were more likely than boys (7.6\%) to say they had been treated differently because of their religion (Table 92).

Both groups agree that children are allowed to speak different languages in their school (Table 94). More girls (49.2\%) than boys (37.1\%) say they have good grades (Table 95).

In terms of attitudes towards multiculturality, girls on average are more likely to agree that migrants should keep their culture and customs (average $4.2 \mathrm{vs}$.3.89 ) and that they like having a multicultural class/school (average 4.28 vs. 3.86) (Table 96). There are no gender differences in terms of friendships from different countries (Table 97).

## Ethnicity - Well-being and everyday life

The children could choose several answers when asked about their ethnicity. The majority, $74.9 \%$ of the children, said they were Slovenian, $36.4 \%$ belonged to one of the ethnic groups of the former Yugoslavia (13\% Bosnian, 8.2\% Serbian, 5.5\% Croatian, 5.2\% Albanian, 3.1\% Macedonian, 1.4\% Montenegrin), 2\% Italian, 0.3\% Roma 0.4\% and other $5.9 \%$ (including Russian $0.7 \%$ and Ukrainian $0.5 \%$ ). The multiple responses were recoded into three groups. Those who selected only Slovenian ethnicity ( $62.8 \%$ ), those who selected
mixed ethnicity (Slovenian and other), and those who selected one, two or more migrant ethnicities (Table 98).
97.9\% of newly arrived migrant children, 78.9\% of long-term migrant children and $12.6 \%$ of local children, thus those without migration experience, chose a migrant ethnicity. $2.1 \%$ of the newly arrived migrant children, $8.5 \%$ of the long-term migrant children and $74.6 \%$ chose only the Slovenian ethnicity. None of the newly arrived children, $12.7 \%$ of the long-term migrant children and $12.8 \%$ of local children chose the Slovenian and the migrant ethnicity (Table 99).

Children with a migrant background show a statistically significant higher well-being than children with a mixed or Slovenian background. They are generally more satisfied with their lives, feel that they have what they want in life, like being who they are and are positive about their future. The only dimension of well-being where the average score was lower compared to other groups was, unsurprisingly, the one related to support in their local environment. As these are mostly newly arrived migrant children, their social network in local community may not yet be as developed. The least satisfied with their well-being are children with mixed Slovenian and ethnic migrant backgrounds (Table 100). This group consists of $10.7 \%$ long-term children and $89.3 \%$ of local children, which we can assume are children of migrant parents born in Slovenia.

There were no significant differences between the three groups when it came to meeting and playing with friends in their free time or using computers and smartphones to communicate with friends and relatives (Table 101). However, there were differences in terms of participation in organised leisure activities or lessons outside school. Thus, 72.4\% of the children with a migration background rarely or never participate in such activities. This figure is significantly higher than that of children of mixed (50\%) or Slovenian (55.9\%) ethnic origin. Moreover, the three groups spend a similar amount of time alone.

In relation to family and friends, children of mixed ethnicity are more likely to agree that their family will help them if they need help (average 4.66 compared to 4.54 for children of mixed ethnicity and 4.58 for children of Slovenian ethnicity). Children of mixed ethnic background are on average more likely to agree that they have a friend who supports them (4.69 compared to 4.57 mixed and 4.54 Slovenian) (Table 102). Children with a migrant background are less likely to spend time with other friends outside school (54.7\%) than children with a mixed ( $75.3 \%$ ) or Slovenian background (71.2\%). They also spend less time with their friends online ( $44.5 \%$ - often) than children with a mixed ( $48.8 \%$ - often) or Slovenian background (53.9\%) (Table 104 and Table 104).

## Ethnicity - School life

There are no differences between the three groups in terms of acceptance and care for them by their peers. The three groups also tend to agree that teachers listen to them and take into account what they say. Children from mixed ethnic backgrounds are less likely to agree that teachers accept them the same way as their classmates ( 42.5 often), compared to children of migrant ethnicity ( $57.9 \%$ often) or Slovenian backgrounds ( $56.6 \%$ often) (Table 106). They are also the least likely to agree that their teachers talk about different countries, languages, cultures or religions ( $8.8 \%$ often), compared to children of migrant ethnicity ( $25.9 \%$ often) or of Slovenian ethnicity ( $13.1 \%$ often) (Table 106).

With regard to experiences of violence, there were no significant differences between the three groups (Table 107). However, children with a migration background experienced more often that they were treated differently by their teachers or fellow pupils because of their religion, their ethnic origin and the language they speak. That they were treated differently by their teachers because of their religion was reported by $14.2 \%$ of children with a migrant background, $6.3 \%$ of children with a mixed ethnic background and $1.8 \%$ of children with a Slovenian ethnic background. The percentages are higher in relation to being treated differently by their classmates because of their religion ( $23.4 \%$ with a migrant background, $14.5 \%$ with a mixed background and $3.4 \%$ with a Slovenian background). 20\% of children with a migrant background, $11.7 \%$ of children with a mixed ethnic background and $2.5 \%$ of children with a Slovenian ethnic background stated that they had been treated differently by their teachers because of their ethnicity. The same applies to different treatment by their classmates. More migrant children were also treated differently by their teachers ( $21.3 \%$ migrant, $14.6 \%$ mixed and $2.5 \%$ Slovenian) and by their classmates ( $25.3 \%$ migrant, $10.8 \%$ mixed and $2.7 \%$ Slovenian) because of the language they speak (Table 108).

The three groups generally agree, but children with a migrant background agree to a lesser extent that they are allowed to speak other languages at school ( $83.5 \%$ migrant, 91.7\% mixed and 90.1\% Slovenian) (Table 109).

Children with a Slovenian ethnic background are more likely than the other two groups not to know whether teachers sometimes speak to children in other languages in class (Table 110). There were no significant differences between the three groups in terms of selfperceived school success (Table 111).

In terms of attitudes towards multiculturality, children with a migrant background expressed the highest levels of agreement with statements about migrants preserving their culture (average 4.4 migrant, 4.26 mixed and 3.87 Slovenian), about interculturality in their class/school (average 4.50 migrant, 4.37 mixed and 3.86 Slovenian) and about the relationships between pupils of different ethnicities in their class (average 4.37 migrant, 4.37 mixed and 4.19 Slovenian). Children with a Slovenian ethnic background are the least positive about multiculturality. The average is still quite high (Table 112).

Children with mixed or migrant backgrounds have more friends from different countries. Thus, $14.8 \%$ of children with Slovenian ethnic background, $44 \%$ of children with mixed ethnic background and $52.3 \%$ of those of migrant ethnic background stated that they have several friends in different countries (Table 113).

Citizenship - Well-being and everyday life
None of the newly arrived migrant children, $36.6 \%$ of long-term migrant children and $96.3 \%$ of local children have Slovenian citizenship (Table 43). On average, children without citizenship are more satisfied with their lives, have what they want, are positive about their future and like being who they are ( 4.24 without citizenship and 3.74 with citizenship). The latter is statistically different. The only dimension of well-being where the average was lower compared to the children with citizenship is the one related to receiving help from people in their local environment when they are in need (Table 114).

In terms of time spent outside of school, there were also differences in relation to meeting and playing with friends. For example, $45.9 \%$ of respondents with citizenship and less, $39.4 \%$ of respondents without citizenship reported meeting and playing with friends. This is not surprising as $87.4 \%$ of non-citizen children without citizenship are newly arrived children or children of long-term migrants and may not have made many friends yet (Table 115).

On average, children without citizenship (4.69) rely more on their family to solve their problems than children with citizenship (4.58). There were no differences between the two groups on other dimensions related to friends and family, as both agree to the same extent that their parents listen to them and take into account what they say (4.15) and that they have enough friends (4.35). Also, children with (4.57) and without citizenship agree that they have a friend who supports them (4.55) when they have problems (Table 116).

While both groups spend about the same amount of time with friends from school, children without citizenship spend significantly less time with other friends (57.4\%) than those with citizenship ( $69.4 \%$ ) (Table 117). Both groups spend similar amounts of time with friends face-to-face and online (Table 118).

## Citizenship-School life

There were no significant differences between the two groups in terms of school life. Nevertheless, more children without citizenship (58.9\%) said they often feel safe at school than the children with citizenship ( $47.6 \%$ ). They also say they often feel OK when a teacher asks them a question ( $25.5 \%$ without citizenship and $18.9 \%$ with citizenship) (Table 120). Both groups of children generally feel accepted, cared for and considered by their classmates and their teachers. The only statistically significant difference was in the statement that teachers discuss intercultural issues. Here, more non-citizen children (31.9\%) than citizen children (12.9\%) agreed that this happens often (Table 120).

Violence was experienced about equally often by both groups. A slight, though not statistically significant, difference was seen in relation to teasing, name-calling, etc., where children without citizenship (19.1\%) more often than children with citizenship (11\%) said that this happened to them three or more times (Table 121). Children without citizenship were more often felt they were treated differently by their teachers and classmates because of their ethnicity/culture, religion and language they speak. Children without citizenship were treated differently by their teachers ( $23.2 \%$ without citizenship and $6.1 \%$ with citizenship) and by their classmates ( $29.2 \%$ without citizenship and $5.6 \%$ with citizenship) because of their language. This also applies to ethnicity, as they felt treated differently both by teachers ( $23.6 \%$ without citizenship and $5.3 \%$ with citizenship) and to a greater extent by their classmates ( $28.7 \%$ without citizenship and $5.8 \%$ with citizenship). Finally, they also felt treated differently because of their religion by teachers ( $12.1 \%$ without citizenship and $4.2 \%$ with citizenship) and their classmates ( $28.6 \%$ without citizenship and $6.7 \%$ with citizenship) (Table 122).

Both groups agree that children are allowed to speak other languages in their school (Table 123). Those without citizenship agree to a greater extent (61\%) that teachers sometimes speak to children in other languages during lessons (49\%) (Table 124).

Self-perceived academic success is similar in both groups (Table 125). In relation to views on interculturality, children without citizenship are on average more likely to agree (mean score 4.36) that pupils coming to Slovenia from other countries should have the right to follow the customs of their countries than children with citizenship (3.99). They are also more in favour of multiculturality in their class (average 4.46) compared to pupils with citizenship (mean score 4.01). Both groups are similarly likely to think that the students in their class get along well, regardless of the different ethnicities/cultures/religions (Table 126). Finally, $98.9 \%$ of non-citizen children have several or few friends from different countries, compared to $85.1 \%$ of citizen children (Table 127).

Religion - Well-being and everyday life

About one third of the children stated that they did not belong to any religion, one fifth of the children stated that they were Roman Catholic (21.4\%), while $18.8 \%$ did not want to give an answer or did not know, 17.4\% stated that they were Muslim and 8.9\% Orthodox (Table 129). The variable was recoded into three main groups: 1) Christianity (Roman Catholic, Protestant) and Eastern religions (Hinduism, Buddhism), which were combined as there were only 3 representatives of Eastern religions, 2) Islam and 3) a group of children not belonging to any religion. Those who did not know or did not answer the question were excluded from further analyses (Table 129).

There were statistically significant differences between the three groups in terms of wellbeing. While all groups tended to rate various dimensions of well-being positively (average just below or above 4), children of Muslim religion were on average more positive about satisfaction with their lives, fulfilment of their life aspirations, orientation towards the future and perceived help from the local community. Those who did not belong to any religion had the lowest average score of the three groups for all the dimensions of well-being listed (Table 130).

In terms of time spent out of school, children who belong to Islam significantly less often participate in organised leisure activities or classes outside school (72\% - rarely or never) than children who belong to Christianity or Eastern religions ( $63 \%$ - rarely or never) and especially children who do not belong to any religion ( $52.4 \%$ rarely or never). There were no differences in other leisure activities such as meeting, playing with friends, using smartphones or computers to keep in touch with friends and relatives or spending time alone (Table 131).

On average, all three groups strongly agree with the statements regarding their relationship with family and friends. Those who belong to Islam agree with all statements slightly more often than the other two groups. For example, children who belong to Islam on average more often agree that their family will help them with a problem ( 4.73 compared to 4.56 for Christians and Eastern and 4.56 not affiliated with religion) and that their parents will listen to them ( 4.31 compared to 4.11 for Christian and Eastern and 4.05 for nonreligious). They also on average agree more that they have a friend who supports them in times of need ( 4.68 vs. 4.58 Christianity and Eastern and 4.58 not affiliated with religion.) (Table 132).

Outside school, all three groups spend time with friends from school, but children belonging to Christianity and Eastern religion more often (73.5\%) also spend time with other friends - from the neighbourhood etc., compared to children not belonging to any religion ( $67.6 \%$ ) and especially children belonging to Islam (57.6\%). On the other hand, more children who do not belong to any religion said that they do not spend time with friends from school outside of school (29.3\%), compared to children who belong to Christianity and the Eastern religion (17.8\%) or Islam (17.8\%) (Table 133 and Table 134).

## Religion - School life

Children affiliated to Islam more often express higher levels of satisfaction with school and belonging to class and school. For example, $28.9 \%$ of children from an Islamic background said that they often enjoy being at school. This figure is higher than that of children who belong to Christianity or an Eastern religion (16.6) and children who do not belong to any religion (10.3\%). They also say they feel safer at school (64.4-often) than children who belong to Christianity or Eastern religions (47.2\%) or do not belong to any religion ( $45.9 \%$ ). They also feel they belong to their class more often ( $59 \%$ - often) than children who belong to Christianity or Eastern religions (40.3\%) or do not belong to any religion ( $47.5 \%$ ). In addition, $26.3 \%$ say that it is okay for them when a teacher asks them a question (Christianity or Eastern religions 18.1\% and no religion 19.2\% (Table 135).

The children generally feel accepted and cared for by their teachers and classmates. Children who belong to Christianity or an Eastern religions less frequently (49.3\%) say that their classmates often accept them for who they are compared to the other two groups (percentage around $65 \%$ ). Children who belong to Islam are more likely to report that teachers often talk about other countries, languages, cultures or religions (26.1\%), compared to children who do not belong to any religion (11.6\%) and children who belong to Christianity and Eastern religions (15\%) (Table 136).

Violence was similarly common across religions. However, those belonging to no religion were more likely ( $70.9 \%$ ) to report that they were never excluded from games or activities, compared to $63.3 \%$ of those belonging to Islam and $65.3 \%$ of those belonging to Christianity and Eastern religions (Table 137).

Children belonging to Islam more often said they were treated unfairly by teachers ( $16.7 \%$ ) and even more often by their classmates ( $25 \%$ ) because of their religion, compared to the other two groups where the percentages are much lower for both teachers (4.3\% Christianity and Eastern religions and 2.3\% I am not affiliated with a religion) and classmates ( $9.3 \%$ Christianity and Eastern religions and $2.7 \%$ I am not affiliated with a religion). They were also treated differently because of their ethnicity and the language they speak. 22.2\% of children affiliated with Islam feel they have been treated differently by their teachers because of their ethnicity (compared to $7.2 \%$ who belong to Christianity and Eastern religion and $2.3 \%$ who belong to no religion). The same is true for classmates ( $23 \%$ compared to 7.5\% Christianity and Eastern and 3.2\% I am not affiliated with a religion). In addition, $36.7 \%$ of children who belong to Islam feel treated differently by their teachers because of the language they speak (6.2\% Christianity and Eastern and 2.8\% I am not affiliated with a religion). They were also treated differently by their classmates ( $25.2 \%$ compared to $7 \%$ Christianity and Eastern and $3.7 \%$ I am not affiliated with a religion) (Table 138).
65.6\% of children who belong to Islam and less, 49.8\% of children affiliated with Christianity and Eastern religion and only 44.6\% of children not affiliated with a religion agree that teachers sometimes speak to children in other languages during lessons (Table 140).

Self-perceived academic success did not differ between religions (Table 141). However, there were differences in the perception of multiculturality. Again, children who belong to Islam agree to a higher degree that migrants coming to Slovenia have the right to preserve their culture ( 4.55 vs. 3.77 Christianity and Eastern and 3.97 I am not affiliated with a religion), that they like multiculturality of their class and school (4.67 vs. 3.89 Christianity and Eastern and 3.92 I am not affiliated with a religion) and that they think there are good relations between pupils of different ethnicities and religions in their class ( 4.49 vs .4 .2 Christianity and Eastern and 4.19 I am not affiliated with a religion) (Table 142).
98.3\% of children affiliated with Islam, and $85.3 \%$ of children who belong to Christianity and Eastern religion and $83.9 \%$ of children who do not belong to any religion have friends from different countries (Table 143).

## Socio-economic status - Well-being and everyday life

The vast majority of students (82.7\%) reported being from a middle socio-economic position. Only a few children (12.3\%) reported being wealthier compared to their classmates, and even fewer (5\%) reported being from a lower socio-economic position (Table 144).

Children's well-being increases with their socio-economic position, as reflected in their life satisfaction (average 3.71 lower, 4.14 middle and 4.36 higher), perception of having what they want in life (average 3.06 lower, 3.92 middle and 4.06 higher), a good selfperception (average 3.41 lower, 3.81 middle and 4.13 higher), a positive perception of the future (average 3.42 lower, 4.07 middle and 4.41 higher) and feeling they have support in the local community (average 3.82 lower, 4.20 middle and 4.14 higher) (Table 145).

Participation in organised leisure activities also depends on socio-economic status. For example, $65 \%$ of children with low economic status rarely or never participate in organised recreational activities outside the classroom, compared to $60 \%$ of children with middle
economic status and 49.4\% of children with higher economic status. Similarly, children with a higher economic status play with friends more often. They meet and play with friends every day or almost every day $61.6 \%$ of children who self-perceived to own more material things meet and play with friends more often, $43.7 \%$ of children who reported owning about the same amount of material things as their classmates and only $37.1 \%$ of children with fewer material things. Children from a high socio-economic class also more frequently use smartphone or computer compared to other children. Also, children of lower socio-economic status spend significantly more time alone ( $48.6 \%$ low, $33 \%$ middle and $27.9 \%$ high) (Table 146).

With regard to friends and family, children with a higher economic status express on average a higher level of agreement with the various dimensions. Those with a higher economic status on average more often agree that their family offers them help when they need it ( 4.72 high, 4.62 medium and 3.91 low socioeconomic status) or that their parents listen to them and take into account what they say ( 4.37 high, 4.16 medium and 3.41 low socioeconomic status). In addition to these statistically significant differences, it appears that children of low socioeconomic status are less likely to agree that they have enough friends and that they have a friend who supports them when they have a problem (Table 147).

Socio-economic differences exist in relation to leisure time activities. Statistically, more children of low socioeconomic status report that they do not spend time with friends from school outside of school ( $44 \%$ compared to $22.3 \%$ from middle class and $19 \%$ from upper class) (Table 148). In addition, children with lower socio-economic status less often spend time with their friends online ( $42 \%$ - often) compared to children with middle ( $50.3 \%$ often) or high (57.8\% often) (Table 149).

## Socio-economic status - School life

In relation to school, children of lower socio-economic class less often feel accepted and listened to by both, their classmates and their teachers compared to children of middle or higher socio-economic class (Table 150).

With regard to experiencing violence, psychological violence, such as calling names was least often experienced by children who have about the same amount of material things. Namely, 61\% never experiences mocking (compared to $34.3 \%$ of children of lower class and $45.9 \%$ of children of higher class), $83.8 \%$ of them were never hit or hurt (compared to $68.6 \%$ of children of lower class and $75.3 \%$ of children of higher class). Most of them ( $67.6 \%$ ) were also never left out of games or activities (compared to $37.1 \%$ of children of lower class and 52.4\% of children of higher class) (Table 152).

Children with higher or lower socio-economic status more often felt they were treated differently by their teachers and classmates compared to children of middle economic status for different reasons, including socio-economic status. Namely, 18.2\% of children with higher economic status and $11.8 \%$ of those with lower, compared to $3.4 \%$ of those with middle economic status felt they were treated differently by their teachers because of their socio-economic status and $26.8 \%$ of those with higher economic status, $11.8 \%$ of those with lower economic status compared to $6.3 \%$ of those with middle economic status felt they were treated differently by their schoolmates for the same reason. Children of lower economic status were treated differently by their classmates also because of where they live ( $12.2 \%$ high, $6.5 \%$ middle and $20 \%$ low socioeconomic status) (Table 153).

Regardless of their socio-economic status children say that they are allowed to speak other languages in their school (around $90 \%$ ) and that teachers sometimes speak with
children in other languages (Table 154 and Table 155). There were not significant differences according to socio-economic status in relation to self-perceived school performance (Table 155).

In relation to views on multiculturality, there were not statistically significant differences among the groups (Table 157). Those with high socio-economic status more often stated that they have several or a few friends from different countries/cultures/religions (91.7\%), compared to those of middle socio-economic status ( $86.5 \%$ ) or lower socio-economic status (85.7\%), but the differences are not significant (Table 158).

## 4. Conclusions and discussion

The population in our study reflects the Slovenian migration reality, which mainly attracts economic migrants from the republics of the former Yugoslavia. (SURS, 2018). There were $16.8 \%$ migrant children, $6.6 \%$ newly arrived and $10.2 \%$ long-term children in our study.. They moved to Slovenia mainly from Bosnia and Herzegovina (47.9\%), Kosovo (7.7\%) and Serbia (7.7\%). In addition, about 30\% of the children speak at least one language other than Slovenian in their family environment. The religious diversity corresponds to the ethnic diversity presented, as one fifth of the children declared to be Roman Catholic (21.4\%), 17.4\% declared to be Muslim and 8.9\% were Orthodox.

The children in our study show high levels of general well-being, younger children more than older ones. In terms of ethnicity, children with a migrant background (those who reported belonging to one or more migrant ethnic groups) show higher levels of well-being than children with a mixed or Slovenian background. They are generally more satisfied with their lives, feel that they have what they want in life, like being who they are and are positive about their future. The same is true for newly arrived migrant children and children without citizenship, since these groups largely overlap.

The vast majority of children are supported by their families and friends, with younger children and boys feeling more supported by family and also having enough friends, while girls more often feel they have a supportive friend than boys. In terms of ethnicity, children from mixed ethnic backgrounds were more likely to report feeling supported by their family and friends. The same is true for children who belong to Islam. Friends play an important role in children's lives and they spend a lot of time with them, either online or face - to face. Expectedly, usually having more diverse social networks, older children spend more time with non-school friends. Older children also spend more time online. On the other hand, younger children spend more time just by themselves. Children with a migrant background spend less time with other friends outside of school than children with a mixed or Slovenian background.

Children spend a lot of time on the computer and meeting friends, about half of the children in our sample also participate in organised leisure activities. This is more true for younger than for older children. It is also worth noting that the majority of children with a migration background (which corresponds to a large extent to newly arrived migrant children) spend significantly less time participating in organised leisure activities. As far as religion is concerned, this is especially true for children who belong to Islam.

School plays a central role in the children's lives and it is positive that the majority of children enjoy going to school and feel safe there. They also generally feel that they belong to their class and are accepted by their classmates and teachers. Younger children show more satisfaction with all aspects of school life than older children.

On the other hand, children also experience various forms of peer violence at school, even if these are not very widespread. Psychological violence in the form of taunting, namecalling, spreading lies and the like was most common. More boys than girls experienced physical violence, while more girls than boys were excluded from their games or activities. Children did not often report being treated unequally by their teachers or classmates, as the proportions ranged from $5 \%$ to $14 \%$. However, it is worth highlighting that children with a migrant background were more likely to report being treated unequally by both their teachers and their classmates because of their religion, ethnicity and/or the language they speak. The same is true for children without citizenship and both newly arrived and longterm children, with significant overlap between these groups. In terms of religion, children who belong to Islam also reported being treated differently because of their religion, ethnicity and language.

The children who participated in the survey generally have positive views about multiculturality. They agree that it is important to preserve the migrants' own culture and that they like multiculturality in their class and school. Children with a migrant background, younger children and girls express more positive attitudes towards multiculturality. Children with a migrant background and/or religious affiliation with Islam were also more likely to acknowledge that teachers address multiculturality in their school. Children with mixed or migrant ethnic background additionally have more friends from different countries.

According to our findings, children's socio-economic position influences their general well-being and their well-being at school. Indeed, children's well-being increases with their socio-economic position, which is reflected in their life satisfaction, perception of having what they want in life, good self-perception, positive perception of the future and feeling supported in the local community. Children from a lower socio-economic class are less likely to feel accepted and listened to by their peers and their teachers compared to children from a middle or higher socio-economic class. They also spend less time with friends from school outside of school and with friends on the internet. Participation in organised leisure activities also increases with socio-economic status.

Newly arrived migrant children

The majority of the newly arrived children in our sample (47) are between 14 and 20 years old (57.4\%) and there are more girls (63.8\%). More than half were born in Bosnia and Herzegovina, one in 10 in Serbia, 8.5\% in Northern Macedonia, 6.4\% in Kosovo, 4.3\% in Russia and 4.3\% in Croatia. They are of Bosnian, Serbian, Macedonian, Albanian, Croatian, Chinese, Russian and Ukrainian ethnic backgrounds. Half of them were affiliated with Islam, about three out of 10 are Orthodox and $6.4 \%$ do not belong to any religion. They live with their family in an area where there are many people of different ethnic or religious affiliation. They do not have Slovenian citizenship and state that they like living in Slovenia.

On the positive side, newly arrived migrant children express quite high levels of wellbeing, similar to long-term and local children. They are quite satisfied with their lives, feel that they have everything they want in life and are quite positive about their future. Compared to the other two groups of children, they show a higher level of self-acceptance and positive outlook on the future.

Newly arrived children also feel supported and accepted by their parents and family. They also feel that they have enough friends who also support them. On the other hand, they feel that they find somewhat less support in the local environment. Due to the short time they have spent in the new country (less than three years), this is not surprising.

Compared to local and long-term migrant children they meet with friends less often and also spend less time with their school friends than the other two groups, which could be due to the short length of stay in the new country and the fewer friendships formed as a result. They are also less likely to participate in organised leisure activities, which are often overlooked but are very important anchors that contribute to migrant children's belonging and identity (Grzymala-Kazlowska, 2018), as they provide opportunities to meet new friends, socialise, learn the language and socialise in general.

As school plays a central role for migrant children in making contacts and anchoring themselves in a society (Grzymala-Kazlowska 2016), it is satisfying that newly arrived migrant children express more often that they feel comfortable at school than long-term migrant children or local children, and that they also feel accepted by their classmates and teachers. In terms of discriminatory treatment due to various factors, both newly arrived and long-term migrant children are more likely than local children to report that they have been treated unequally by their teachers and classmates because of their religion, ethnicity/culture and the language they speak.

Newly arrived migrant children are more likely to recognise that teachers addressed multiculturality in school during lessons and express positive attitudes towards multiculturalism in their class and school. They also feel that they are allowed to speak other languages in their school and agree more often than local children that teachers sometimes speak to (migrant) children in other languages. Newly arrived children and long-term migrant children also have more friends from different countries.

## Long - term migrant children

Among long-term migrant children in our sample (72), 41.7\% were born in Bosnia and Herzegovina, $16.7 \%$ in Kosovo, $9.7 \%$ in Austria, $8.7 \%$ in Northern Macedonia, 5.6\% in Serbia, while less than 3\% were born in Ukraine, Russia, Croatia, India, China, Hungary and Switzerland. They are of Bosnian, Albanian, Serbian, Slovenian, Croatian, Montenegrin, Roma, Greek, Chinese, German, Romanian, Russian, Slovakian and Ukrainian ethnic background. Half of them are affiliated with Islam, about two in 10 are Orthodox and 18.3\% do not belong to any religion. More than a third have Slovenian citizenship. They live in a family, half of them say they live in an area where many people belong to a different racial, ethnic or religious group. More than $80 \%$ like living in Slovenia.

Long-term migrant children express high levels of life satisfaction and well-being, similar to the other two groups. They are satisfied with their lives, feel that they have what they want in life and are positive about their future. Long-term migrant children also feel supported and accepted by their parents and family. They feel that they have enough friends who also support them. Compared to newly arrived migrant children, they feel slightly less supported by their parents and more supported by their friends. They also feel that they are supported by people in their local environment.

Compared to newly arrived migrant children, long-term migrant children participate in organised leisure activities more often, but still slightly less often than local children. They spend time meeting and playing with friends, using the computer or smartphone to communicate with family and friends, but also on their own.

Long-term migrant children mostly express that they like being at school, but less than newly arrived migrant children. They feel accepted by their teachers and their school friends.. In terms of discriminatory treatment based on various factors, both newly arrived and long-term migrant children are more likely than local children to report that they have been treated unequally because of their religion, ethnicity/culture and the language they speak.

Like other groups of children, they also feel that children are allowed to speak other languages in their school and that teachers sometimes speak to children in other languages. Like newly arrived children, long-term migrant children are more likely to feel that this happens often or sometimes than local children.

Similar to newly arrived migrant children, long-term migrant children also express positive views about multiculturality. On average, they are more likely to agree that migrants should maintain their customs and culture and that they like multiculturality in their class. Like newly arrived migrant children, long-term term migrant children also have more friends from different countries., long-term term migrant children also have more friends from different countries.

## Local children

Of local children in our sample (590), three quarters were in the older age group and there were about half boys and half girls. They were all born in Slovenia and were of Slovenian (almost 90\%), Bosnian, Croatian, Serbian, Macedonian, Montenegrin, Italian, Hungarian and Roma ethnic backgrounds, but there were also individual cases of Austrian, Bulgarian, French, Canadian, Chinese, Moldavian, Russian, Scottish, Swedish, Australian and Turkish ethnic backgrounds. Compared to migrant children, they are less likely to belong to a religion, as one in four do not belong to any religion, a quarter feel they belong to the Roman Catholic religion, one in 10 to Islam and $5.9 \%$ to the Orthodox religion. More than a quarter have parents who were born in another country. Only 2\% of local children do not have Slovenian citizenship. Compared to migrant children, local children live more often in rural areas. They also perceive the area they live as ethnically less diverse. Although the percentage of those who said they liked living in Slovenia is very high, it is somewhat lower than for newly arrived and long-term migrant children.

Like newly- arrived and long-term migrant children, local children express high levels of well-being in terms of satisfaction with their lives, agreement that they have what they want in life and positive future prospects, but on average somewhat less than newly arrived and long-term migrant children. Compared to children with a migrant background, they have more support in the local environment. They generally feel supported by family and friends. Compared to newly arrived migrant children, they are less likely to enjoy being at school.

Local children more frequently participate in leisure activities more often than both, newly arrived and long-term migrant children, meet and play with friends. They also frequently use the smartphone or computer to communicate with friends, but less frequently than newly arrived migrant children.

Compared to the other two groups, local children were less likely to say that their teachers talk about other cultures, religions, etc. Local children agree that children are allowed to speak other languages in their school and that teachers sometimes speak to children in other languages, but migrant children are more likely to say that this happens often or sometimes than local children.

Local children are also less positive about multiculturality. On average, they are less likely to agree that migrants should maintain their customs and culture and that they like multiculturality in their class and school in comparison to both, newly arrived and long-term migrant children. Compared to migrant children, they also have fewer friends from other cultures.

In summary, schools are recognised as playing a crucial role in the lives of all children and also in the lives of migrant children and their integration (Bešter, 2009; Janta and Harte, 2016; Jalušič, Bajt and Lebowitz, 2019). Therefore, it is positive that all children, including newly arrived and long-term migrant children most often perceive school as a safe and pleasant place where they feel accepted and supported. Nevertheless, it is important to address the perceived unequal treatment of migrant children based on their nationality/ethnicity, religion and language. Indeed, the Slovenian education system often
reproduces social inequalities, prejudices and discrimination, although at the same time it has the potential to address and combat them (Milharčič-Hladnik, 2012, Sedmak, 2013, Medarić et al. 2021). It would therefore be relevant to introduce the principle of interculturality at all levels of society, including curricula, and to address the attitudes, stereotypes and prejudices of both learners and teachers, as is often suggested (see Skubic Ermenc, 2006). Another issue worth exploring is also the result that migrant children are less often included in organised leisure activities than local children. Our qualitative research (Sedmak and Dežan, 2021) shows that leisure activities are vital for their well-being and allow them to spend time with peers as well as extend social networks and thus contribute to the sense of belonging and connecting to the new society.

## 1. Introduction

The project MiCREATE deals with the integration of children from a child-centred perspective. The following report presents the results of the quantitative survey in eight different Viennese schools and one Viennese pupil organization in Austria. First, the methodology is explained and major difficulties and hurdles of data collection due to the Corona pandemic are addressed. Then, the data are described to clearly show the sample population. Afterwards, different categories and existing differences are pointed out. Finally, a chapter with the summary of all results follows.

## 2. Methodological approach

The survey was conducted from March 2020 to May 2021. All pupils from six Viennese schools, who were also part of the qualitative field research, were able to participate. Due to the Corona pandemic, one of the six school no longer wanted to participate in the study. In addition, it was difficult to find enough participants, so three additional schools and one student's organization had to be brought in during the further data collection process. In two of the new schools, only the survey was conducted and there was no contact with teachers or pupils other than this data collection. Unfortunately, due to the Corona pandemic, this was not possible otherwise. In total eight Viennese schools and one student organization participated. At these Viennese schools, all pupils between the ages of ten and eighteen were eligible to participate in the survey.

For data collection, it was first necessary to obtain consent from parents or guardians and participants. In some schools, it was possible to obtain the printed consent forms before the Corona pandemic. Here it became already clear, that the pupils are difficult to motivate for the survey. Some feedback from the pupils was that they did not know what to expect and what questions would be asked. Since they mostly had little experience with empirical research. Another aspect regarding the consent forms was that they were not understandable for all parents and guardians, which is why there were repeatedly incomplete consent forms. In addition, some pupils did not return the completed forms or forgot them. Due to the lockdown, the consent forms had to be sent to the teachers. They printed them out and gave them to the pupils. Overall, the consent forms proved to be a hurdle to participate in the online questionnaire, so it was decided to include it in the questionnaire. This made it possible to consent to participation directly in the questionnaire. In addition, participation with only online consent was restricted to fourteen to eighteen year olds from this point on, as these can participate without parental consent in accordance with Austrian law.

A total of 493 pupils between the ages of 10 and 18 participated. Most of the surveys were conducted via CAWI. Only at the beginning of the quantitative survey was it possible to visit the schools and conduct the survey face-to-face. A total of four researchers were involved in the process. School staff assisted in finding participants and asked other teachers to participate with their classes. Some also conducted the survey in the classrooms. But most pupils did it independently. Due to the Corona pandemic, much depended on the commitment of the teachers. On the one hand, they were gatekeepers to other teachers to spread the word about the survey, and on the other hand, they were able to motivate the pupils to participate. As already mentioned, the most challenging aspect of data collection was finding participants. Even after recruiting three new schools and one student organization to participate in the survey, most of the pupils could not be motivated. Targeted incentives would have been necessary here to increase participation.

## 3. Results

What follows is the presentation of main findings from the quantitative research in Austrian primary and secondary schools.

### 3.1 Sample population

## Demographic data

Table 1 lists the age distribution of the sample. Whereas the smallest age groups are found in the youngest (age 10-12) and oldest (age 18-19) of the interviewees with a share varying between $1 \%$ and $4.9 \%$, the biggest age groups are found in the intermediate range, consisting of 13 - to 16 -year-old pupils with a sample share between $16 \%$ and $19.5 \%$.

In terms of gender (Table 2), the sample consists of 54.8\% girls, 43.8\% boys, and 1.4\% other gender. Thus, the study shows a small surplus of girls. Distributed across the two recoded age groups (Table 3), female respondents in the younger age group make up a smaller proportion (47.2\%) than boys, but they dominate the older age group (59.1\%). Gender and the likelihood of being in the younger or older group appear to be associated.

Table 4 shows the ethnic background of the respondents. It can be seen that four-fifths of the respondents ( $79.3 \%$ ) are from Western Europe and thus form the most dominant ethnic group. This is followed by respondents from Asia, who make up $9.9 \%$ of the sample. Another 5.3\% come from the former Yugoslavia and 4.5\% from Eastern Europe. With 0.6\%, respondents from Africa make up the smallest ethnic group in the sample.

Table 5 shows how many languages are spoken by the respondents at home. It shows that with $80.3 \%$ it is most likely that they speak one language at home. These are, for example, Turkish, German, Serbian, etc., 10.6\% of the respondents speak two languages at home, one of which is non-European. Another 6.8\% of the respondents speak two European languages at home. A small proportion of the sample speaks 3 or more than three languages at home ( $2.4 \%$ in total). In summary, one-fifth of the respondents have a multilingual home and of the other four-fifths there is a great diversity among the one language spoken at home.

According to Table 6, the vast majority of respondents (in total 96.8\%) said they speak German well to very well. More precisely, nearly two thirds said they speak German very well ( $62.2 \%$ ). In comparison to that only in total $3.2 \%$ indicate, that they speak German not well, little, or not at all. This means that the German language ability of the interviewed students is high.

This characteristic of the sample could be connected to the fact, that nearly four-fifths of the respondents ( $77.69 \%$ ) said that they were born in Austria, as listed in Table 7.

In addition to the 78\% of respondents born in Austria, the other countries of birth vary greatly. They are presented in Table 8, with countries indicated by less than one percent of
the respondents grouped together in the category "other then Austria" for clarity. They consist of, for example, Egypt, Cambodia, China, Croatia, Greece and so on. With 3\%, the most frequent respondents who were not born in Austria stated that they were born in Serbia. This was closely followed by respondents with the place of birth Syria (3\%). 2\% of the respondents were born in Afghanistan. All other countries of birth such as BosniaHerzegovina, Bulgaria, Germany, Iraq, Iran, Poland, Romania, Russia and Slovakia each account for $1 \%$ of the sample. In summary, it can be said that respondents with Austria as their country of birth dominate, with Serbia and Syria in second place.

Table 9 shows descriptive statistics for the question for whether respondents were born in Austria or moved to Austria. Three time criteria were defined and the sample was divided into these three categories. "Newly arrived" means that the interviewees have moved to Austria in the last three years. This category accounts for $12 \%$ of the respondents. 16.8\% of the sample accounts for the category "Long term". It describes those of the respondents who moved to Austria more than three years ago. The last category "locals" describes those of the interviewees, that were born in Austria. At, $78.3 \%$, this makes up the largest group of the sample. There is a strong tendency among respondents to have been born in Austria or to have moved to Austria more than three years ago. In the following subchapter 3.2 "newly arrived, long-term and local children" this variable will be labelled "time of arrival".

However, this proportion of respondents who were born in Austria does not match the proportion of respondents with Austrian citizenship (68.9\%), as one might assume (see Table 10). The percentage of students who do not have an Austrian citizenship is $24.6 \%$, and the percentage of those who do not know is $5.3 \%$. The fact that $1.2 \%$ of respondents refuse to answer this question could indicate that the question refers to an undesirable topic. Whereby the number of respondents indicating this last category is too small for a statistical evaluation.

Table 11 shows the distribution of whether one has Austrian citizenship or not under the condition of gender.The proportion of girls and boys whether they have an Austrian citizenship or not or do not know aligns almost exactly with the overall gender distribution of the sample (girls 54.8\% and boys 43.8\%).

A similar pattern as in Table 11 is also describable in Table 12. Split by age group membership, the proportion of younger respondents who either have an Austrian citizenship ( $34.5 \%$ ) or not ( $34.2 \%$ ) is comparable to the general share of younger respondents of the sample ( $36.5 \%$ ). The same applies in reverse for the older respondents. The probabilities of having Austrian citizenship or not do only very slightly change under the condition of age group membership.

In contrast, $38.5 \%$ of the respondents who do not know whether they have Austrian citizenship belong to the older group, while $61.5 \%$ belong to the younger group. This differs from the general age distribution of the sample. Broken down by age group, it seems reasonable to assume that, in general, knowledge of one's own nationality could be related
to the age of the respondents. Whereby the number of respondents indicating this category is too small for a statistical evaluation.

As listed in Table 13, more than two-thirds of respondents (69.4\%) indicated that at least one parent was born in another country. This means the parents of less than one-third of the sample were born in Austria. In this sense, the proportion of respondents in the sample with at least one parent who migrated to Austria predominates.

With regard to the question of which religion the interviewees are affiliated with (Table 14), the largest group, $39.8 \%$, states that they are Christians. The second largest group, at $35.7 \%$, is made up of Muslims. In third place, $14.2 \%$ of respondents say they do not belong to any religion. A total of $3.8 \%$ stated that they belonged to the Alevi, Buddhist or Sikh religion. At 4.9\%, respondents stated that they belong to religions other than those mentioned in the questionnaire. The more detailed breakdown of this domain is given in the Table 15. With regard to religions other than those available for selection in Table 15, it turns out that $2.4 \%$ of the respondents belong to the Orthodox Church, 1.9\% are Serbian Orthodox and $0.6 \%$ have indicated flying spaghetti monster, Jehovah's Witnesses or Satanism as their religious denomination.

Almost all respondents of the study are resident in Austria's capital Vienna. Accordingly, there are hardly any respondents who do not live in a large city. Table 16 shows how many respondents live in the inner districts and in the outer districts of this city. The latter can partly also be described as suburbs. The highest number of student respondents live in the outer districts of the city with $77.3 \%$. Almost a quarter live in the inner districts of Vienna (22.7\%). Only 1\% of the persons live outside the city in rural areas. At 78.8\%, the majority of respondents reported living in a diverse neighbourhood (see Table 17). Accordingly, onefifth of the sample (21.3\%) reported living in a homogeneous neighbourhood. The interpretation is permissible that most of the respondents is used to a diverse environment.

The vast majority of students (90.6\%) said they liked living in Austria, while a minority of $9.4 \%$ said they did not (see Table 18). This indicates that satisfaction with one's place of residence is high among the sample. Of the respondents who would not like to live in Austria, the USA was named most frequently as a desired place of residence with $17 \%$ (see Table 19). The second most common place they would like to live is Germany (15\%), followed by Turkey (10\%) and Serbia (9\%). The domain "other" groups together the desired countries that were only mentioned once and makes up $17 \%$ of the respondents who do not like to live in Austria. Preferred countries are, for example, Egypt, Bosnia-Herzegovina and France. In summary, it can be said that, apart from the USA and Germany, the desired places of residence indicated vary greatly among the respondents.

Table 20 lists the respondents' perceptions of their family's socioeconomic status. On the one hand, $15.2 \%$ of students reported that there is no difficulty for their family to meet economic necessities. On the other hand, $6.8 \%$ of the respondents has difficulties in covering economic necessities. The most common answer, $78 \%$, is that the family has some
difficulties in meeting the economic needs. Consequently, the respondents in the sample are most likely to have slight difficulties in meeting their families' economic needs.

The probability of living with one's own family is $94.4 \%$ in the sample (see Table 21). This means that $5.6 \%$ of the sample is made up of those students who do not live with their family.

## Well-being and everyday life

Table 22 lists how the pupils generally feel about their lives. When it comes to well-being and everyday life, nearly half of the respondents stated, that they are completely satisfied with their life (47.4\%), followed by 29.9\% who would agree. Interestingly, a full $14.7 \%$ said they were not or not at all satisfied with their lives. A similar pattern can be described when it comes to the question of whether the respondents like being the way they are. Here, onefifth ( $19.4 \%$ ) indicated that they disagree or strongly disagree with this statement. At the
same time, a total of $71.5 \%$ stated that they either agree or strongly agree that they like being the way they are. Although more than one in ten students are dissatisfied with their lives and one in eight students do not like how they are doing, 89.2\% of respondents indicated that they have what they want in life. This indicates that there is a strong tendency for respondents' needs to be met. There is also a tendency to be positive about the future. Almost three quarters of respondents (72.4\%) said they agreed or strongly agreed that they had a positive outlook for the future. 14.1\% had an indifferent opinion and about 13.5\% disagreed to varying degrees that they had a positive outlook on the future.

Table 23 focuses on how free time is spent by respondents. Outside of school, students are most likely to spend most of their time staying in touch with their friends and family via digital devices ( $81.1 \%$ ) or spending time alone ( $42.2 \%$ ). This is followed by weekly playdates with friends (53.3\%) and participating in recreational activities as well as classes outside of school (41.9\%). Being alone at least once or twice a week is also quite popular at $42.2 \%$. Compared to all categories, not having regular recreational activities or classes outside of school is the most likely at 27.4\%.

The question of how much the respondents can rely on their social environment is answered in Table 24. In general, the sample shows a high probability of both finding support and a sympathetic ear in their families and friends and of being considered by their families. In all categories, more than four-fifths agreed or strongly agreed that they get help from their families (85.6\%) and friends (84\%) when they have a problem, that they are taken seriously by their families (85.1\%), and that they have enough friends (84.6\%). In contrast, less than one-tenth of students in all categories describe a life situation in which they seriously lack support from a social network.

Table 25 shows the respondents' likeliness to spend time with different groups of friends outside of school. Since multiple responses were possible, the probability to often spend time with friends from school and or other friends outside of school hours was indicated by about half of the students ( $51.1 \%$ and $46.7 \%$, respectively), while $19.5 \%$ indicated that they would not spend time with friends outside of school. A possible explanation for why about a quarter of the respondents reported do not spend time with friends during their free time could be found in special circumstances of social isolation during the Corona Lockdowns in 2020 and 2021.

With regard to the question of how much time respondents spend with their friends face-to-face on the one hand and online on the other, differences in response behaviour emerge (see Table 26). Thus, respondents are more likely to spend time with their friends online often ( $35.2 \%$ ) than face-to-face ( $13.5 \%$ ). Face-to-face time with friends is more likely to be spent "occasionally" (33.4\%) or "sometimes" (34.6\%). This shows that respondents are most likely to spend their free time online with friends "often" to "sometimes". Face-to-face, they are most likely to spend their free time "occasionally" or "sometimes".

Table 22 - Life satisfaction

|  |  | strongly <br> disagree | disagree | I neither disagree nor agree | I agree | I strongly agree | Total |

## School life

Table 27 shows how the students experience the school, their class, their teachers and classmates. It shows that in all categories more than half of the respondents stated that they "sometimes" to "often" feel good about the different levels of school.

It is noteworthy that with $19.3 \%$ "often" and $36.6 \%$ "sometimes", "being at school" is the least liked in relation to the response behaviour in the other categories. A similar assessment is evident in relation to the question of how often respondents feel okay with what their classmates think about them. Here 34.4\% of respondents feel this way "often" and 33.7\% "sometimes". Otherwise, respondents are most likely to feel "often" safe at school (43.6\%), to feel like they belong to their class ( $43.8 \%$ ) and to feel okay with being asked a question by teachers (46.9\%). In summary, it can be said on the basis of the data that school attendance and the relationship with one's own class, classmates and teachers tend to be perceived as pleasant and okay.

In Table 28 the subject of the frequency of good relationships among the pupils in the classes as well as attentiveness of the teachers was addressed. A majority of the respondents indicated that they often felt accepted by their classmates (55\%), as well as that this acceptance was also shared by their teachers (57.7\%). As the frequency that this is the case decreases from "sometimes" to "never", so does the frequency distribution from around one-quarter to around one percent. The distribution of domain frequencies is comparable in these two variables.

A similar pattern is found in the likelihood of how often it was indicated that teachers listen to and are considerate of the pupils. $47.9 \%$ of students stated that this happens often, while $32.3 \%$ said it is sometimes the case. With decreasing frequently, $12.3 \%$ said it is the case once in a while, while $7.5 \%$ said their teachers rarely to never listen to them or consider their opinions.

Slightly different was assessed how often the classmates care about how one respondent feels. With $33.5 \%$ it is most likely that they are found to sometimes care about the respondents feelings closely followed by $26.7 \%$ of the respondents stating that this is often the case.

In relation to the other Variables that teachers talk about different countries, languages, cultures or religion is found to happen occasionally to sometimes. It turns out that the likelihood of teachers addressing religious, cultural, linguistic, and regional diversity is occasionally (35.4\%) to sometimes (32.7\%) the case.

The probability that the respondents did not experience violence from their fellow students is comparably high, at $80.8 \%$. In sum $19.2 \%$ reported to have experienced such violence one to more than tree times in one school year (see Table 29). This pattern repeats, when asked, if the respondents have been left out by games or activities. $70.1 \%$ said they had experienced no such social exclusion, while about one-fifth had been in such a situation one to three times (20.8\%) and a minority of about one-tenth had been in such a situation more than three times in the recent school year.

The possibility of being subject to bullying, defamation, disclosure of confidential information appears to be more likely among the respondents. While half ( $48.1 \%$ ) said they had not had such experiences, one-third (34.6\%) reported that it had happened one to three times in a school year and $17.2 \%$ said it had happened more than three times.

Table 30 lists if there has been unfair treatment by the teachers or classmates because of nominal attributes of the respondents. There is an overall tendency to not have experienced such unfair treatment by teachers, with a likeliness varying between $71 \%$ and $96.9 \%$. This tendency is even more evident concerning the lack of unfair treatment by classmates, ranging around $83.8 \%$ to $97.2 \%$. At $29 \%$, the likelihood of experiencing discrimination by teachers in relation to nominal characteristics is highest for gender. This is followed by discriminatory treatment by teachers ( $16.4 \%$ ) as well as classmates ( $15.3 \%$ ) with regard to
the "nationality/race" of the respondents. Treatment by teachers based on the language one speaks was also described as unfair in $12.5 \%$ of cases as well as classmates in $11.6 \%$ of cases. In terms of being permitted to speak a language other than German during breaks at school, $28.4 \%$ of students indicated that they were not allowed to do so (Table 31).

The probability that a teacher frequently speaks to students in another language or asks about their pronunciation knowledge is quite low at $7.2 \%$. It is more likely that this happens once in a while (42.1\%) (see Table 32). One-third of respondents indicated that this never happens (34.3\%). This frequency distribution shows that a multilingual background of the pupils does not play a central role in the school.

In Table 33 the respondents were asked how they rated their school performance relative to other classmates. It turns out, that a majority finds itself in line with the general performance (57.7\%). A little less than one third (31.4\%) even indicates to do better in school than fellow classmates, whereas every tenth person (10.9\%) reported to have a relatively lower level of performance. When looking at the numerically inconsistent selfassessments of better or worse school performance, a general tendency to rate one's own performance better than the average becomes apparent.

In relation to several questions on the extent to which diversity may be lived by schoolchildren, the respondents answered relatively uniformly (see Table 34). The statement that students have a right to live the customs of their countries of origin was disagreed with by a total of $5.7 \%$, while $66 \%$ "strongly agreed" and $22.1 \%$ "agreed". With regard to the statement that respondents have classmates of different backgrounds in their school and class, agreement among respondents was even higher ("strongly agree" 75.9\%, "agree" $15.6 \%$ ). The impression that students from different backgrounds get along well with each other was shared by almost four-fifths of the respondents with $77.9 \%$ "strongly agree" and another 17.5\% "agreed".

This shows that living one's own diversity in Austria, especially at school and in the classroom, is not perceived as problematic and is approved of by the respondents. As Table 35 shows, a large majority (92.5\%) of respondents reported having a few to several friends from different countries or cultures or religions. Not having any friends with different regional, cultural or religious backgrounds is rather unlikely at 4.8\%.

### 3.2 Newly arrived, long-term and local children

This subchapter focuses on the variable that describes if the respondents were born in Austria or have moved to Austria and if so when. "Locals" make up $78.3 \%$ of the sample. Followed by $16.8 \%$, who moved to Austria more than three years ago, named "Long term", and $12 \%$ "Newly arrived", who moved to Austria in the last three years. In the following part, this variable will be labelled "time of arrival".

## Demographic data

Table 36 looks at the probability of when respondents were in Austria for the first time, conditional on the age group to which they belong. Since the group "newly arrived" has a small number of cases its explanatory power is low. Nevertheless, it is included in the following analysis. There is a general tendency in each category (local, long term, newly arrived) to be more likely part of the older age group (14-19 years) than the younger age group (10-13 years). The proportion of newly arrived respondents divided by age is in a ratio of one-third $37.5 \%$ ) to two-thirds ( $62.5 \%$ ), with older respondents making up the larger group. The same accounts for the proportion of locals with $35 \%$ of them being younger and $65 \%$ being older. A small deviation is found in the proportion of respondents belonging to the group of long-term residents. Here, the age membership distributes slightly different:

The probability to be part of "long term" under the condition of belonging to the older age group lays at $58.5 \%$, whereas for the same category but under the condition of belonging to the younger age group, the probability lays at $41.5 \%$. Based on these data, it can be interpreted that there was an increased migration of families with infants and toddlers to Austria more than three years ago. This migration dynamic weakened in the last three years, or perhaps the children who migrated to Austria in the last three years were not enrolled in the schools that are part of this study. Also, the migration dynamics were weaker more than 14 years ago and fewer children with a migration background in the family were born in Austria.

Similar to the general dominance of girls (54.8\%, see Table 37) in the sample, girls dominate in all three expressions of the variable "time of arrival," broken down by gender. However, the distribution of the shares of boys and girls varies depending on how long the respondents have been living in Austria. Girls, for instance, are most likely to have lived in Austria "long term" (59.8\%), i.e. for more than three years. This is also the characteristic that boys state least often (40\%). Boys are most strongly represented in the "local" category. The distributions roughly correspond to the expected frequencies. Accordingly, a rather weak correlation can be assumed between the two variables "gender" and "time of arrival".

Table 38 shows the ethnic background of the respondents, broken down by "migrant status". The persons born in Austria are 100\% from Western Europe. 8.75\% of the "long term" respondents and $4.2 \%$ of the "newly arrived" respondents are also from Western Europe. This means that respondents of Western European ethnicity are most likely to have been born in Austria. The probability that respondents come from Eastern Europe is highest
for respondents who have lived in Austria for more than three years (21.25\%), followed by respondents who have lived in Austria for less than three years (16.7\%).

Among the "newly arrived" respondents, 37.5\% and among the "long term" respondents 20.0\% come from the former Yugoslavia, which makes it most likely that persons with former Yugoslav ethnicity are respondents who have been in Austria for less than three years. "Long-term respondents are $48.75 \%$ likely to be of Asian ethnicity and newly arrived respondents are $33.3 \%$ likely. With regard to persons with African ethnicity, the absolute values are too small for a permissible interpretation. It can be assumed that there are differences in the central tendencies of domains of the variable "migrant status" with regard to the question of which ethnical background the respondents do have.

In summary, ethnic background varies among newly arrived and long-term respondents, in stark contrast to local respondents. This variation could be explained by different immigration dynamics to Austria in recent years, but this cannot be verified on the basis of the available data.

Table 39 lists the probabilities of speaking a language at home, broken down by "migrant status". The likelihood of speaking a language at home is highest if the respondent arrived in Austria less than three years ago ( $90.00 \%$ ). $82.37 \%$ of the "local" respondents also have a monolingual household. For the "long term" respondents, the probability of speaking a language at home is $69.06 \%$. This is the group that shows the lowest probability of speaking only one language at home in relation to the other groups. Thus, this group dominates when it comes to living in bilingual households where at least one language is not of European origin (18.06\%). In second place, with $10.00 \%$, are those respondents who came to Austria less than three years ago. It should be noted here, with regard to the meaningfulness of the percentage value, that this is a very small group in absolute terms. In third place are the "local" respondents, $8.96 \%$ of whom speak two languages at home, at least one of which is not of European origin.

Two European languages are spoken at home by $9.72 \%$ of the "long term" respondents and $6.65 \%$ of the "local" respondents. A vanishingly small proportion of these two groups also speak three or more languages at home. In summary, the respondents of all groups are most likely to speak one language at home, with the "newly arrived" respondents dominating. Two languages (be it exclusively European languages or at least one nonEuropean language) are spoken by $27.89 \%$ of the "long term" respondents and $15.61 \%$ of the "local" respondents.

The correlation between the variables "time of arrival" and "German language skills" is weak to medium (The probability of speaking German very well as a " local " respondent is the highest of all categories, at $68.8 \%$. Another good third of " locals" say they can speak German "well" (34.2\%). This group thus rates its German language skills highest of all groups. They are followed by the "long-term" respondents, $46.3 \%$ of whom said they could speak German "very well" and a good half ( $51.2 \%$ ) said they could speak German "well." Respondents who came to Austria less than three years ago ranked third on the scale of how
well they assessed their own language skills. Newly arrived" respondents are most likely to be able to speak German "well" (62.5\%). Only $16.7 \%$ or in total numbers four persons each from this group stated that they could speak German "very well" or "a little". Based on these data, it can be assumed that the length of a respondent's stay in Austria is related to the ability to speak German.

Asked about their place of birth, all "local" respondents answered "as can be assumed" that they are from Austria (100\%) (see Table 41). The respondents who came to Austria more or less than three years ago accordingly do not have Austria as their place of birth, but show various places of birth. A quarter of the newly arrived respondents were born in Serbia ( $35 \%$ ). Thus, Serbia is the most likely place of birth of this group. Of the "long term" respondents, $15.2 \%$ were born in Syria, which makes Syria the most likely country of birth for this group. Another 11.4\% of the "long term" respondents stated Afghanistan and 7.6\% Russia as their place of birth. All other countries of birth were given in absolute numbers of no more than 5 people. Under "other", those countries of birth were grouped together that were only mentioned once by the respondents. These are, for example, Cambodia, China, Uganda, etc. As can be seen, almost four fifths of the respondents were born in Austria (78.7\%), whereby the "local" respondents are one to one. The other fifth is spread over a total of 29 countries of birth.

As can be seen in Table 42, the statements on the possession of Austrian citizenship diverge strongly between respondents of the different "time of arrival" characteristics. The probability of possessing Austrian citizenship is highest if the respondents were born in Austria. For four fifths of them this is the case (81.6\%). The probability of holding an Austrian passport decreases the shorter the respondents have been in Austria. Thus, one-fourth ( $25.6 \%$ ) of those who have lived in Austria for more than three years say they possess such a document. This is even less the case for respondents who have lived in Vienna for less than three years. $17.4 \%$ of them state that they have Austrian citizenship. It is striking that 17.1\% of respondents who have lived in Austria for longer do not know whether they have Austrian citizenship. Why this is unclear cannot be answered here.

According to Table 43, respondents living in Austria "long term" most frequently (89.7\%) have at least one parent who was not born in Austria. Among persons who came to Austria less than three years ago, this is second most often the case, at $83.3 \%$. At $64.2 \%$, more than half of the respondents born in Austria have at least one parent who was not born in Austria. Accordingly, it is most common for this group, compared to the others, to have all parents also born in Austria, namely 34.8\%. The probability that the parents were also not born in Austria thus increases under the condition when respondents themselves were also not born in Austria.

Respondents who are "locals" or "newly arrived" are most likely to be Christian, with $46.2 \%$ and $47.8 \%$ respectively (see Table 44). Next to this, approximately $30 \%$ of these two groups also state that they are of the Islamic faith. With regard to respondents who have lived in Austria for more than three years, i.e. who belong to the "long term" group, this ratio is different. Half of the respondents in this group (48.8\%) are of the Islamic faith and a
quarter (24.4\%) of the Christian faith. Thus, respondents who have lived in Austria for more than three years but were not born there are most likely to have an Islamic denomination. While it is more likely for the other two cases to be of Christian faith.

There are no significant differences between the respondents in terms of place of residence, broken down by "migrant status" (see Table 45). In all groups, the probability of living in the outer districts of the city strongly predominates (77.9\% "local", 76.5\% "long term", $70.0 \%$ "newly arrived"). The newly arrived respondents were most likely to live in the inner districts of the city with 30\%, followed by the long-term respondents with $23.5 \%$ and the local respondents with $22 \%$.

As shown in Table 46, all respondents are more likely to have a neighbourhood consisting of people with different ethical, religious, or racial backgrounds than not. At the same time, one third of respondents who have lived in Austria for less than three years say they do not have such a neighbourhood. This is less often the case under the condition of having lived in Austria for more than three years (18.3\%) or having been born in Austria (21.4\%). Due to the low number of cases in the "newly arrived" group, it is difficult to deduce a distinct relation between the variable "migrant status" and "diverse neighbourhood".

The probability of liking to live in Austria, broken down by "migrant status," is almost identical to the general probability of all respondents liking to live in Austria (see Table 47). Thus, the variables "migrant status" and "satisfaction with place of residence" are stochastically independent variables. It is therefore the case for all groups, as for the entire sample, that they are very likely ( $87 \%$ to $91.5 \%$ ) to live in Austria. Approximately every tenth respondent does not like his or her own country of residence.

Of those respondents who would not like to live in Austria, divided according to "migrant status", one third each of the "newly arrived" respondents stated that they would like to live in Serbia (33.3\%) or the USA (3.3\%) (see Table 48). This makes Serbia and the USA the most popular countries within this group, but also in comparison to the other groups. With $23.5 \%$, the "long term" respondents favour Turkey as their place of residence. Germany and the USA come in second place with $17.6 \%$ each. Among the "local" respondents, Germany was named most frequently as the desired place of residence (16\%), followed by the USA with 16\%.

In summary, the country of choice varies among the three "migrant status" groups, with the USA among the top three most frequently named places of choice for all three. Table 49 shows the extent to which the respondents' families, broken down by migrant status, have problems paying for economic constraints. Keeping in mind that the number of cases is very small (25), the respondents who have been living in Austria for less than three years are the most likely to state ( $25 \%$ ) that their family has no difficulties in meeting economic needs compared to the other groups.

After that, the "local" respondents state that $15.3 \%$ of them have no economic problems in their family. In relation to this category, it is those respondents who came to Austria more
than three years ago for whom it is least likely (12.5\%) that their families have no economic problems.

For all groups, it is most likely to live in families with some economic problems. Here the "long term" respondents dominate with $81.3 \%$, closely followed by the "locals" $77.8 \%$ and in last place the "newly arrived" respondents with $70.8 \%$. Statistically meaningful percentages in relation to strong economic problems in their own family are found in relation to the "locals", who assign themselves to $6.9 \%$ to this category. It is admissible to say that there is a high tendency that respondents of all domains of the variable "migrant status" have to struggle with some economic problems in their family.

Regarding the question of whether respondents live with family members, there are small differences when broken down by "migrant status" (see Table 50). For all three groups it is very likely that they live together with family members ( $89 \%$ to $95.8 \%$ ), whereby the "newly arrived" respondents with $11 \%$ are most strongly in the group of those who live without family members. In summary, more than nine out of ten respondents live with a family member.

Figure 49. 1

Table 50 - Migrant status x Do you live with the members of your family?

Figure 50. 1

Well-being and everyday life
Table 51 shows how satisfied the pupils are with their lives in general, broken down by "migrant status". On average, the "newly arrived" respondents showed higher satisfaction in three out of four categories than the "long term" or "local" respondents. Thus, the respondents who migrated to Austria less than three years ago are, on arithmetic average, more satisfied with their lives, largely like themselves and have positive prospects for the future. Only with regard to the question of whether the respondents have what they want in life were the "local" respondents on average most likely to be satisfied here.

In Table 52, the students were asked how often they engage in which leisure activity, broken down by their time of arrival. Of the four possible topics, all groups most frequently indicated that they are in contact with friends and relatives via smartphone or laptop. Thus, the "locals" spend $83 \%$ of their time in this way, followed by the "newly arrived" and the "long terms" with about 75\%. Accordingly, "locals" are most likely to use digital devices frequently to daily to keep in touch. The dominance of this leisure mode could be due to the Corona Lockdowns in 2020 and 2021 in Austria, where physical contact with friends and relatives had to be minimized. The difference along the groups raises the question whether it can be explained by the fact that they have different levels of access to digital devices. These questions cannot be answered with this data set.

The second most common response from all groups was that they spend time alone frequently to daily. This could also be explained by the corona lockdowns and the physical distancing they demanded. On the one hand, the "newly arrived" are the most likely to spend time alone frequently to daily, at $54.2 \%$. At $43 \%$, the "locals" are also frequently alone almost every day or every day after school. "Long term" respondents, on the other hand, are more likely to spend their free time alone once or twice a week, not every day, at 48.8\%.

Meeting and playing with friends once or twice a week is most likely for over half of the respondents in each of the "migrant status" categories. For example, "newly arrived" and "long term" respondents say they are about $58 \%$ likely to do this once or twice a week. Followed by the locals, at $52.4 \%$, though they are more likely to physically meet friends frequently to daily relative to the others at 35.5\% ("newly arrived" 25\%, "long term" $25.6 \%$ ). The frequency with which the respondents of the different groups participate in organized leisure activities differ slightly. The trend is that the "locals" participate least frequently in such organized recreational events ( $29.3 \%$ Rarely or never), while the "long terms" most consistently take part in such offerings once or twice a week or more frequently. At $37.5 \%$, the "newly arrived" are most active in organized recreational activities and classes that occur almost daily to daily.

However, they are on second place when it comes to participating in such organized leisure activities once or twice a week ("newly arrived" 37.5\%, "long term" 45.1\%).

With regard to the arithmetic means of the values of the independent variable "migrant status" and the question of how the respondents perceive the support of family and friends, it can be seen that the "newly arrived" respondents on the one hand experience relatively
more support from their parents and on the other hand have less support from their friends than the other groups (see Table 53). Thus, the "local" respondents stated more frequently in the arithmetic mean that they have enough friends (mean 4.39) and are supported by them as soon as they have a problem (mean 4.26). the "long term" respondents are almost exclusively in relation to the questions in the arithmetic mean between the two groups "newly arrived" and "local". For the "newly arrived" respondents, this was on average the least frequent of all groups ("enough friends" mean 4.27, "support from friends" mean 4.18). However, this group felt most often supported by their families in problem situations (mean 4.43) and perceived by their parents (mean 4.43). It could be said that in the sample the "newly arrived" respondents experienced a stronger family connection, while those respondents who have been in Austria for a long time have a stronger network of friends. At the same time, however, the generalisation to the population is not permissible.

More than half of the respondents said they often spend time with school friends outside of school (Yes: "newly arrived" 54.2\%, ""long term" 53.2\%, "local" 51.2\%). There are hardly any differences between the groups (see Table 54). The same applies to the frequency with which respondents stated that they do not spend time with friends outside of school. This was stated by about one-fifth of the respondents (Yes: "newly arrived" 18.2\%, "long term" $21.5 \%$, "local" $22.92 \%$ ). The commitments to social isolation during the corona lockdowns in Austria may have had an influence on this variable, but this cannot be discussed in more detail at this point.

Differences can be found when it comes to the question of whether respondents of different "migrant statuss" often spend time outside of school with friends who do not attend the same school. Here, at 62.5\%, it is most likely that this is the case for the "newly arrived" respondents. Less than half of the respondents in the "long term" and "local" groups said that they often meet friends outside of school (Yes: "long term" 45.5\%, "local" 46.7\%). In summary, respondents in all "migrant status" groups most often meet friends from school in their free time. Friends who do not go to their own school are most likely to be met by "newly arrived" respondents. No friends are met by about one-fifth of the respondents in their free time.

With regard to the question of how often respondents, divided according to the length of time they have been in Austria, spend time with their friends face-to-face, it emerges that the "newly arrived" respondents spend time with their friends significantly less frequently than respondents who have been in Austria for more than three years (see Table 55). Thus, at $45.8 \%$, they are much more likely to meet friends only occasionally than to meet them more often and more frequently ( $33.3 \%$ overall). About half of the respondents who are "long term" in Austria or who are "locals" meet their friends face-to-face sometimes to often ("long term" 51.9\% in total, "locals" 48.1\% in total). Approximately one third of both groups meet their friends face-to-face only occasionally and thus have more frequent physical contact with their friends than the "newly arrived" respondents.

Figure 55.1

## School life

The following section examines the various questions on the respondents' everyday school life, broken down by length of stay in Austria.

Table 56 deals with the frequency with which the respondents perceive belonging to a school as pleasant in relation to various levels. It can be seen from the data that the frequency of whether respondents feel comfortable with different situations in relation to school increases from "never" to "often." So the tendency is that more respondents feel comfortable more often, and few respondents feel comfortable rarely. There are two
exceptions to this. First, when asked if they like going to school, respondents from the "long term" and "local" groups are more likely to say "sometimes" than "often," at 37\% each. Second, "long term" respondents are more likely to be "sometimes" okay with what their classmates think of them (38.9\%) than that they are often (26.4\%). Broken down by "time of arrival," it appears that the "newly arrived" respondents in three out of five questions, are the ones who are most often comfortable with school. This is the case in relation to whether they like going to school ( $37.5 \%$ "often"), whether they feel safe at school ( $56.5 \%$ "often"), and whether they feel okay with what their classmates think of them ( $43.5 \%$ "often"). In the other two questions, "newly arrived" respondents are most likely to say they feel comfortable, namely in the categories "I feel like I belong in this class" with $48.8 \%$ and "I am OK when a teacher asks me a question" with $53.1 \%$. The statements of "local" respondents vary in comparison. For example, they are the ones least likely to frequently like going to school ( $16.4 \%$ ), but most likely to frequently feel like they belong in the class ( $42.5 \%$ ), most likely to frequently feel safe in school (43.1\%), most likely to frequently be OK with being asked a question by teachers (45.3\%), and likewise most likely to frequently be OK with what their classmates think of them (35.5\%).

In Table 57 the subject of the frequency of good relationships among the pupils in the classes as well as attentiveness of the teachers disaggregated by "migrant status" is listed. It can be seen from the data that the frequency of whether the respondents feel comfortable with different situations in relation to classmates and teachers increases from "never" to "often" apart from the variables "My teachers talk about different countries [...]" and "My classmates care about how I feel". In relation to this, with the exceptions mentioned, more than half of the respondents, divided according to "migrant status", almost always state that they "often" feel accepted and empathically perceived. The general tendency is therefore that more respondents feel more often comfortable in relation to their classmates and teachers, divided according to "migrant status", and few respondents rarely feel comfortable.

Regarding the exceptions, the question whether the respondents feel that their classmates are perceptive towards them is answered rather with "sometimes" by the "long term" and "local" respondents ( $31.3 \%$ "long term", $34.4 \%$ "local"). Only the "newly arrived" respondents are most likely to answer "often" (38.1\%). The situation is similar regarding the question of whether teachers talk about diversity with students. Here, the "newly arrived" respondents answered that this is most likely to be the case "sometimes" (31.8\%). This is shared by the "long term" respondents with $40 \%$. When it comes to respondents from the "local" group, the probability is even higher that they state that teachers "occasionally" talk about diversity (36.3\%).

So, on the one hand, there seems to be a tendency for teachers to not bring up diversity that often, and at the same time for classmates to not be found to be as sympathetic. Otherwise, respondents from different "migrant status" groups encounter acceptance and attention from their classmates and teachers. In summary, it is the "newly arrived" respondents who experience their schooling most positively, followed by the "long term" and the "local" respondents.

Table 58 lists, by time of arrival, how often respondents experienced exclusion, bullying, or physical violence by their classmates in the last school year. The likelihood of having experienced physical violence in the last school year is small among the respondents. While none of the "newly arrived" respondents stated that they had ever experienced this, one fifth of the "long term" and "local" respondents each stated that they had experienced physical violence at least once ( $10.5 \%$ "long term", $10.2 \%$ "local"). Regarding the question whether the respondents have experienced exclusion by their classmates, it turned out that this is least often the case for "newly arrived" respondents (81.8\%), followed by "long term" respondents ( $71.8 \%$ ) and finally "local" respondents ( $69 \%$ ). Accordingly, as a respondent from the "local" group, it is most likely to have experienced violence once (14.3\%) to several times (16.7\%) in a school year.

When it comes to bullying, the distribution looks different. While it is still most likely, with about half of the respondents in each "migrant status" group, not to have experienced bullying in the past school year, the probabilities are considerably higher compared to the other domains. For example, at $27.3 \%$, "newly arrived" respondents are most likely to have been bullied between two and three times after no bullying experience. For "long term" respondents, after no bullying, it is even most likely to have been bullied more than three times in the past school year (20.5\%), while for "local" respondents it is most likely to have experienced it once (20.1\%). Thus, it appears that frequencies vary by "migrant status" group and frequency of bullying, physical violence, or social exclusion, but this does not follow a clearly discernible pattern.

Looking at Table 59, which shows whether unfair treatment was experienced by classmates or teachers based on nominal characteristics, one domain stands out. Unfair treatment by classmates as well as teachers in connection to the language a respondent speaks aggregated by "migrant status" is associated significantly. A closer look reveals that it is especially those respondents who have lived in Austria for more than three years (24.7\% "long term") who are discriminated against by their teachers with regard to speaking other languages besides German. In comparison, respondents in the other two groups were less likely to report experiencing this, at around $10 \%$. When it comes to discrimination based on language by classmates, in addition to $20 \%$ of the "long term" respondents", $21.1 \%$ of the "newly arrived" respondents are also affected. t can thus be seen that speaking a language other than German is relatively often used as a reason for unfair treatment, i.e. discrimination against these persons, especially against respondents who were not born in Austria.

Looking at Table 60, it can be seen that "newly arrived" respondents, in contrast to "long term" and "local" respondents, state more frequently (95.2\%) that they are allowed to speak a language other than German outside of class. In comparison, this is only allowed for about $70 \%$ of "long term" and "local" respondents. One reason could be that respondents who have only lived in Austria for three years find it more difficult to speak German and it is accordingly important to allow them to speak other languages at school.
"Newly arrived" respondents are more likely to be asked by their teachers to use a language other than German (18.2\%) than "long-term" and "local" respondents (see Table 61). In contrast, the latter two are more likely to be "never" asked by their teachers to use a language other than German in class (35.3\% "long-term", 35.3\% "native") than the "newly arrived" respondents ( $22.7 \%$ ). Respondents who have lived in Austria for less than three years are thus more often asked about their language skills other than German than respondents who have lived in Austria for longer than three years.

In the self-assessment of their own school performance in comparison to their school peers, subdivided according to "time of arrival", a difference between respondents who were born in Austria and those who moved to Austria later becomes apparent (see Table 62). For example, less than a quarter of the "newly arrived" and "long term" respondents rate their school performance as above average (22.7\% "newly arrived", 23.7\% "longstanding"). In comparison, the "local" respondents rate their performance even better at 33.5\%. The gap between the groups "newly arrived" and "long term" and the group of "natives" is relatively smaller when respondents rate their school performance as worse than average. Thus, on the one hand, approx. $13 \%$ of the respondents who came to Austria stated that their school performance is below average, while on the other hand $10 \%$ of those born in Austria indicated this.

Table 63 shows the arithmetic means of the independent variable "migrant status" in connection with questions on the respondents' assessment of cultural, religious and regional diversity in Austria and the school. It shows that the longer respondents have been in Austria, the more acceptable ("local" mean 4.62), perceptible ("long term" mean 4.70) and pleasant ("long term" mean 4.73) they find diversity on average. On the other hand, respondents who moved to Austria less than three years ago find it less important that diversity can be practised in Austria (mean 4.26), that there are students from different backgrounds in their school (mean 4.62) and that these students get along well with each other (mean 4.62).

The likelihood of having friends from diverse countries, cultures and religions is higher the shorter the respondents have lived in Austria (see Table 64). For example, more than two-thirds of respondents who moved to Austria less than three years ago say they have several such friends ( $68.2 \%$ ), while this is true for less than half of respondents who have lived in Austria for more than three years.

### 3.3 Analyses according to demographic variables

## Age - Well-being and everyday life

Table 65 shows how the pupils generally feel about their lives, broken down by age group. It can be seen in relation to the statement "I am completely satisfied with my life" and "I feel positive about my future" that the mean values differ more between the two age groups, which coupled with smaller standard deviations is an indication of a difference between the two groups in how positively one's future is seen and how satisfying life is. There is a
statistically significant difference between the two age groups in terms of how satisfied they are with their lives and likewise in terms of how positive they are about their own future

In Table 66 the association between the variables of leisure time activities and age group membership is displayed. It turns out, that there is a significant association between the domain "Meeting, playing with friends" and age group membership. The probability to meet and play with friends every day or nearly daily if one is a member of the younger group lays at $32.2 \%$ and is therefore smaller than being a member of the older age group, at $77.7 \%$. As can be seen in Table 67, there are significant differences between the statements of respondents of different ages, in relation to whether or not their own family is supportive when problems arise.

When it comes to the question of with whom the respondents spend their time often outside of school, a stochastic independence between the two variables "Out of school, I spend time with friends from school" and age group as well as "out of school, I don't spend time with friends" emerges (see Table 68).

The situation is different for the variables "Out of school, I often spend time with my other friends" and age group. The probability of being younger under the condition of meeting other than school friends often outside of school hours is higher than that of being older, at 55.7\%.

The ways in which respondents interact with their friends outside of school hours and how often they do so are shown in Table 69, broken down by age group. It can be seen that the probability of spending time online with friends outside of school more often (sometimes to often) is higher if the respondent belongs to the older age group (73.7\%) than if the respondent belongs to the younger age group (67.3\%).

## Age - School life

With regard to their school life, the respondents were asked in Table 70 how they are doing with school, teachers and classmates. A significant association of the variables "I like being in school" and "age group" was found. It shows that the younger respondents like being in school more often than the older respondents. Thus, $27.4 \%$ of the younger respondents stated that they often like being in school, whereas this is only the case for $14.7 \%$ of the older respondents.

Significant associations with the variable age group can be found between the variable "My classmates accept me just the way I am" and age group as well as the variable "My teachers listen to me and take what I say into account" and age group (Table 71).

The assessment of how often respondents experience acceptance of them from their classmates differs with respect to their age. Older respondents experience acceptance from classmates more often than younger respondents. The majority of the members of the older age group ( $60.6 \%$ ) state that they often feel accepted as a whole person by their classmates. In contrast, this is true for only $45.5 \%$ of the members of the younger age group. The effect is small but significant (ü $=0.003$ ), with Cramer`s $V=0.187$.

The trend is reversed when it comes to how often respondents, broken down by age group, feel they are considered by their teachers. Here, as a member of the younger age group it is more likely to feel more considered by teachers (57.8\%) than being a member of the older age group ( $42.2 \%$ ). This relationship of age and perceived attention by teachers is weak at a significance level of 0.022 with Cramer`s $\mathrm{V}=0.159$.

A significant correlation (sig 0.022) exists between the variable age group and the frequency of experienced physical violence by schoolmates (see Table 72). In this case, the tendency can be observed that for younger respondents the probability of having experienced violence from classmates at least once is slightly higher ( $26.3 \%$ ) than it is for older respondents (15.2\%). The correlation between these two variables is weak with Cramer`s V $=0.142$.

Looking at Table 73, which shows whether unfair treatment was experienced by classmates or teachers based on nominal characteristics, three particularities stand out. First, both age groups are highly likely to state that they have not been treated unfairly by either classmates or teachers. Second, there is little difference in the frequency with which unfair treatment by classmates was experienced, broken down by age. Finally, the frequency data by age group diverge when asked about having experienced unfair treatment by teachers.

Here, the likelihood of having been treated unfairly by teachers is higher for members of the older age group, especially in terms of language, nationality/race, religion, and gender. The biggest difference in the frequency of mentioning experienced discrimination is in relation to the nationality of the respondents: here, older respondents are $21.2 \%$ more likely to have experienced such discrimination and younger respondents are 8.1\% more likely. In summary, then, unfair treatment based on nominal characteristics by teachers increases with the age of the pupils.

From Table 74 it can be seen that the probability of having permission to speak a language other than German outside school is slightly lower (68\%) if the respondent belongs to the younger age group than if the respondent belongs to the older group ( $73.7 \%$ ). In other words, one third of the younger pupils are not allowed to speak another language, while this is the case for only one quarter of the older pupils.

The probability of how often another language is spoken in class, divided according to age group, is slightly different (see Table 75). Thus, older students state more frequently ( $46.1 \%$ ) that this is sometimes the case than younger students do (35.1\%). At the same time, the frequency of students indicating the other domains saying that they do not speak another language in class, or that they do so often, or that they do not know, differs by only about 5\% between the age groups, which shows little difference between the age groups.

The distribution of the probability of how well the respondents assessed their performance in comparison to their classmates divided by age group membership is similar to the overall distribution of the probability of how well the respondents assessed their school performance in comparison to their classmates (see Table 76). In terms of differences between age groups, it can be noted that the percentage of students who rate their performance better than average is slightly higher among older respondents (32.\%) than among younger ones (28.7\%).

Table 77 presents how respondents find and feel about cultural, religious and linguistic diversity in their school, broken down by age group. It shows that there are significant differences between the age groups when it comes to the question of how much they like having pupils from diverse backgrounds in their class ( $U=21779.000, p=0.037$ ). It is also valid to say that there is a significant difference between the age groups in terms of whether students from diverse backgrounds get along well with each other in their class ( $U=$ 21813.000, $p=0.038$ ).

The probability of having many friends from different countries if the respondents belong to the younger age group is 49.1\%. Comparably, slightly more than half of respondents in the older age group (52.8\%) report having many such friends (see Table 78). The probability of having a few foreign friends is slightly higher (45.1\%) if respondents belong to the younger age group than if they belong to the older group (38.8\%). The probability of having no foreign friends is low in comparison, whether respondents are older or younger.

## Gender - Well-being and everyday life

In the following subchapter the variables of the topic area well-being and everyday life as well as school life are analysed on the condition of gender. While there was a possibility for children to select also the answer »other«, the numerus was too little to make any comparative analyses, therefore these answers were left out.

Table 79 shows how the students generally feel about their lives, broken down by gender. With regard to the statement "I am completely satisfied with my life", "I have what I want in life" and "I feel positive about my future", the mean values differ more between boys and girls. This coupled with smaller standard deviations is indicative of a difference between the two groups in how positive they feel about their future, whether they like themselves and how satisfying life is. The Mann-Whitney $U$ test shows that there is such a statistically significant difference between the two gender groups in terms of how satisfied they are with their lives. This is also the case with regard to how much respondents of different genders like themselves and how positive they are about their own future

Table 80 lists the probabilities of how frequently the respondents spent their leisure time in what way under the condition of their gender. Overall, the probabilities of respondents staying in touch with friends and relatives via digital devices, divided by gender (boys $78.5 \%$, girls $82.6 \%$ ), are the highest. In terms of leisure activities that involve physical interaction with people, such as participation in sports groups or music, boys are more likely to engage in such activities than girls. Thus, the probability of participating in organized recreational activities or classes is $41.4 \%$ if the respondents are boys. For girls, it is $22.6 \%$. Comparable probability differences are present in relation to (play) dates with friends. At $38.4 \%$, more boys do this than girls, for whom the probability is $28.6 \%$. Regarding the point of how likely it is to spend free time alone, there are hardly any differences divided by gender. This type of leisure activity is one of the more popular among leisure options for both genders.

When comparing the arithmetic means of the answers to the question of how large and supportive the respondents' social environment is, broken down by gender, it can be seen that girls gave lower values on average in all the four categories (see Table 81). For example, their frequency of response to the question whether their family helps them when problems arise (mean 4.23), whether their family is attentive to them (mean 4.24), whether they have enough friends (mean 4.25) and whether they receive support from these friends when they are having problems (mean 4.26) is always lower than that of the boys. The boys more often experience support from their family (mean 4.56) and are recognized by them (mean 4.58). They more often have enough friends (mean 4.56) and are supported by them when there are problems (mean 4.29). It could not be determined that this difference in response behaviour in relation to these questions is significant when broken down by gender.

With regard to the question whether girls and boys among the respondents often spend time with friends from school in their free time, girls are more likely to do so (54.3\%) than boys (49.4\%) (see Table 82). The situation is similar between boys and girls with regard to the question of whether they often spend time in their free time with friends who do not go to the same school (yes: $46.1 \%$ "girls", $48.6 \%$ "boys"). Overall, this is less likely for both genders than meeting friends from school. When asked if they never spend time with friends in their free time, $24.6 \%$ of the girls answered "yes" and $18.5 \%$ of the boys answered "yes". So, it shows that girls are most likely to spend often time in their free time with friends from school and with friends who do not go to their school, as well as that they are most likely not to meet any friends at all outside of school.

The likelihood of spending face-to-face time with friends outside of school sometimes to often is higher overall for when respondents are boys (53.3\%) than when respondents are girls (43.8\%) (see Table 83). Accordingly, the likelihood of only occasionally spending time physically with friends is higher for girls (37.8\%) than for boys (29\%). A slightly opposite trend, broken down by gender, is seen in the likelihood of spending free time with friends online. Girls do this sometimes to often $74.1 \%$ overall and boys $67.5 \%$. Here, girls thus spend slightly more time online with friends and relatives than boys.

## Gender - School life

Table 84 shows, broken down by age group, how often respondents feel comfortable belonging to a school. Looking at the table, it can be seen that the likelihood of feeling comfortable at school sometimes to often is generally high for both girls and boys. On the one hand, the percentage of girls and boys is comparatively low when it comes to the question of whether they often enjoy being at school ( $15.7 \%$ girls, $23.6 \%$ boys). On the other hand, both genders often feel they belong to the class ( $42.5 \%$ girls, $45.3 \%$ boys) as well as often find it okay to be asked questions by teachers ( $40.5 \%$ girls and $55.4 \%$ boys). Broken down by gender, it appears that the likelihood of often feeling okay about school, classmates, and teachers is higher for boys than for girls. For girls, this feeling of being accepted at school is more likely to be something that happens sometimes or occasionally.

When asked how often girls and boys indicate that teachers talk about regional, linguistic, cultural, or religious diversity, differences become apparent (see Table 85). There is a higher tendency, $52.8 \%$, to say this happens sometimes or often when it is a girl. Boys report this $39.4 \%$ of the time. When it is a boy, teachers are more likely to classify discussing regional, language, cultural, or religious differences as occasional (40.9\%). The effect of gender on the frequency of teachers addressing differences is very weak with sig. 0.025 and Cramer`s $V=0.025$.

When asked how often boys and girls have experienced bullying at school, some differences are visible in terms of gender (see Table 86). The likelihood of not having experienced bullying in the last school year as a boy is $53.6 \%$ and is higher than girls, who experienced no bullying at $44 \%$. The frequency of how often such victimization is experienced does not show a linear progression.

Table 87 lists the nominal characteristics on the basis of which respondents have experienced unfair treatment in the school environment, disaggregated by gender. Regarding the probability of having experienced such unfair treatment due to gender by teachers, it is particularly high if the respondent is a boy (34.7\%). This is the highest probability that boys have indicated. At the same time, they estimate such bad treatment by classmates to be low in proportion ( $9.4 \%$ ). The probability of being treated unfairly by teachers based on one's gender is $25.2 \%$ among girls. This form of discrimination is also most frequently reported by girls, as it is by boys. In contrast to the boys, however, being treated unfairly by classmates because of one's own gender is also more likely as a girl, at 20.9\%.

The likelihood of being treated unfairly by teachers and classmates because of one's own nationality/race is significantly different for girls and boys, although the statistical differences is small. Thus girls (By teachers: 17.1\%; By classmates: 16\%) are significantly more likely to be treated unfairly because of their nationality and or race by teachers and classmates than boys (By teachers: 15.8\%; By classmates: 14.8\%) are. Along with gender, this category is the one in which the surveyed boys and girls also most often experience unfair treatment by classmates.

It seems that the table 88 is indifferent. The given probabilities are equal to the expected probabilities, which means that there is stochastic independence of the two variables. In accordance to the general indication of how many respondents stated, that they are allowed to speak a foreign language in the hallway of the school and when playing, disaggregated by gender lays at around $72 \%$. The probability distributions of the two variables gender and permission to speak a foreign language in school appear independent.

The probability of how often another language is spoken in class, disaggregated by gender, is slightly different (see Table 89). Thus, girls state more often (52.2\%) that this is the case than boys do ( $45 \%$ ). Boys are more likely to report that teachers do not ask them to speak another language in class ( $37.8 \%$ ) as well as they are more likely to report that they do not know (17.2\%) than girls (32.5\% "no," 15.3\% "don't know"). The distribution of the probability of how well the respondents assessed their performance in comparison to their classmates divided by gender is similar to the overall distribution of the dependent variable (see Table 90).

In terms of differences between genders, it can be noted that the percentage of students who rate their performance better or worse than average is slightly higher if you are a boy (boys: $32.4 \%$ "Better", $12.6 \%$ "worse"; girls: 29.5\% "better", $9.8 \%$ "worse"). If you are a girl, you are $60.6 \%$ more likely to rate your school performance as average than boys, who rate it as average at 55.1\%.

Broken down by gender, there are differences across the table in the assessment of the role diversity plays at school and in Austria (see Table 91). The arithmetic mean of the assessments given by the girls in the study is always higher than the arithmetic mean of the boys. The girls feel more strongly that pupils who have migrated to Austria have a right to continue practising their own culture and language (mean: girls 4.47, boys 4.45). Likewise, they on average stated more often than the boys that there are pupils with diverse backgrounds in their school classes (mean: girls 4.73, boys 4.52) and that schoolmates of different backgrounds get along well with each other (mean: girls 4.78, boys 4.64).

As can be seen in Table 92, there are hardly any differences between the number of friends of boys and girls in percentage terms. When tested for stochastic independence, the distributions in the gender groups correspond to the expected values and thus there is no correlation between gender and the number of friends with diverse backgrounds. This means that these two variables are independent, and gender does not change, how many friends from different countries or religions one respondent has.

## Ethnicity - Well-being and everyday life

In this chapter, the extent to which the ethnic background of the respondents has effects on various variables was examined in more detail. Since the group of persons of African ethnicity is numerically very small, it is not included in the analysis, but is shown in the tables and graphs.

In relation to the questions on life satisfaction, there was a significant association between the variable "I have what I want in live" and the ethnic background of the respondents (see Table 93). In relation to the other questions, no significant effect size was found.

Table 94 shows, broken down by ethnicity, the activities with which the respondents frequently spend their free time. We found weak but significant associations between ethnicity and participation in organised recreational activities, and between ethnicity and frequency of online contact with friends and relatives with $p$

Among the respondents, it is those of former Yugoslav ethnicity who most frequently participate in organised leisure activities on a daily or almost daily basis (56.0\%). Respondents of Asian ethnicity participate in such leisure activities once or twice (56\%). Overall, this is least often the case for respondents of Eastern European ethnicity (27.3\% "Every day or almost everyday").

In contrast, all groups surveyed frequently keep in touch with friends and relatives via digital media. Every day or almost every day, 96.0\% of the respondents of former Yugoslav ethnicity stated that they use digital media for this purpose. Followed by respondents with Western European ethnicity (82.7\%), those with Eastern European ethnicity (72.7\%) and those with Asian ethnicity ( $63.3 \%$ ). The last group is also the group that uses digital media the least in relation to the other groups overall.

In summary, respondents with former Yugoslav ethnicity are the most likely to engage in an organised leisure activity and also the most likely to use digital media to keep in touch with friends and relatives.

With regard to the question of how the respondents, divided according to ethnicity, perceive their social environment, no significant effects could be found. Thus, no further analysis can follow for Table 95.

Respondents of Asian ethnicity are the least likely to spend time with friends who do not go to their school (39.1\%) and are also the least likely to spend time with friends from school compared to the other groups (47.8\%). In addition, respondents are most likely to be part of this group if they do not meet friends in their free time ( $23.8 \%$ ). The groups of respondents with Western European and Eastern European ethnicity are in between the above groups in terms of whether they meet friends from school, from outside school or no friends in their free time (see Table 96).

When asked whether respondents of different ethnicities see their friends face-to-face outside of school or meet them online, there was a general trend towards online meetings (see Table 97). Here, respondents of former Yugoslavian ethnicity were most likely to do so, with a total of $80 \%$ ("sometimes" and "often"). This is closely followed by respondents of both Western and Eastern European ethnicity (Western Europe: 73.2\% "sometimes" + "often"; Eastern Europe: 72.8\% "sometimes" + "often").

The situation is similar with regard to face-to-face contact with friends. Here it is also most likely to be a respondent of former Yugoslav ethnicity with 82\% ("sometimes" and "often"). With regard to both types of contact with friends, it is the respondents of Asian ethnicity who stated least frequently that they have this contact (face-to-face: 44.9\% "sometimes" + "often"; online: 51\% "sometimes" + "often").

Ethnicity - School life
Table 96 shows, broken down by ethnicity, whether and with which friends the respondents spend time in their free time. It can be seen that, compared to the other ethnic groups, respondents with former Yugoslavian ethnicity spend the most time with friends who do not go to their school (72.0\%) and also spend the most time with friends from their school in their free time (60.0\%). This group is also the least likely to report not meeting friends in their free time (5.6\%).

Table 98 shows how respondents feel about their school, teachers and classmates, broken down by ethnicity. In the categories "I feel safe when I am at school" and "I feel like I belong in my class", "often" was most frequently stated. Only the respondents of former Yugoslav ethnicity stated "sometimes" (I feel safe: 45.8\%; I feel like I belong: 52.0\%) more often than "often" (I feel safe: 41.7\%; I feel like I belong: 36.0\%) in this category. The category "I am OK when a teacher asks me a question" was most frequently stated as "often" by respondents of all ethnicities, with people of Eastern European ethnicity dominating here (61.9\%).

In the categories "I like being in school" and "I feel OK what my classmates think of me", the response behaviour of respondents of different ethnicities varies more strongly, whereby there is always a tendency to feel good about school and classmates more often than less rarely. At the same time, all of them overall least "often" like going to school. Respondents of former Yugoslav ethnicity trust least what their classmates think of them (37.5\% "occasionally").

In Table 99, questions about classmates and teachers are collected and divided according to the ethnic background of the respondents. Initially, it can be seen that there is a tendency in all groups for respondents of different ethnicities to feel accepted, emotionally empathised with and noticed by their classmates and teachers more often than rarely. Alone in relation to the question of whether teachers often talk about different countries, languages, cultures and religions, the most likely answer was "sometimes" (West Europe: 31\%, East Europe 47.6\%, Former Yugoslavia 36.0\%, Asia 37.2\%). Respondents of former Yugoslavian ethnicity are least likely to feel accepted (45.5\%) and perceived (45.5\%) by teachers compared to respondents of other ethnicities.

Table 100 shows whether the respondents of different ethnicities were bullied by their classmates, subjected to physical violence or excluded in the past school year. It shows that in the categories "physical violence" and "exclusion" at least over 68\% of the respondents did not experience this in the past school year. With regard to bullying, it is more often the case that it was experienced at least once. Here it is particularly those of Asian ethnicity who have experienced it frequently ( $23.4 \%$ "more than three times"). Respondents of former Yugoslav ethnicity are most likely to have been bullied one (25\%) to three (25\%) times in the past year.

Exclusion by their classmates was experienced most often by respondents of Asian ethnicity from one (12.8\%) to three (12.8\%) times among the different ethnicities. When asked if students have permission to speak a language other than German outside of class, respondents of former Yugoslav ethnicities answered "yes" most often (82.60\%), followed by respondents of Eastern European ethnicities (77.3\%) and respondents of Western European ethnicities (71.6\%) (see Table 101). Respondents with Asian ethnicities were the least likely of the groups to say they had permission to speak a language other than German outside of class (62.2\%).

A weak but significant correlation with $\mathrm{V}=0.131$ and $\mathrm{p}=0.015$ is present between ethnicity and the frequency with which teachers speak to respondents in a language other than German or ask them for a translation (see Table 102). Thus, all ethnicity groups most frequently stated that this is the case "sometimes", but they differed in frequency. While this was most frequently stated by persons with Eastern European ethnicities with 54.5\%, only $37.5 \%$ of persons with former Yugoslavian ethnicities stated this. The picture that emerges is that persons of Western and Eastern European ethnicities experience it more often "sometimes" that their teachers speak to them in a language other than German than was the case for persons of non-European ethnicities. But overall, it is the respondents of Eastern European as well as former Yugoslavian Ethnicities that are spoken to in languages other than German by the teachers.

Table 103 shows the extent to which respondents of different ethnicities rate their school performance as above average, below average, or average. As can be seen in this table, people with Western and Eastern European ethnicities rate their school performance as above average more often than people with non-European ethnicities. Thus, on the one hand, $34 \%$ of persons of Western European ethnicities and $27.3 \%$ of persons of Eastern European ethnicities state that they have above-average school performance. While 25\% of respondents of former Yugoslav ethnicities and $15.6 \%$ of respondents of Asian ethnicities state this.

Regarding the question of how respondents of different ethnicities feel about statements on diversity, no significant effects could be found (see Table 104). Accordingly, no statement can be made based on the present data material.

Table 105 shows whether and how many friends with diverse backgrounds respondents of different ethnicities have. It turns out that respondents with former Yugoslav ethnicities are most likely to have several friends from different countries and/or with different cultures and religions ( $75 \%$ ). This is followed by respondents with Eastern European ethnicities with $63.36 \%$ and respondents with Asian ethnicities with 63\%. Lastly, 47.7\% of respondents with Western European ethnicities say they have several friends with diverse backgrounds (47.7\%). This latter group is more likely to have a few such friends (44\%). Overall, the likelihood of having friends with diverse backgrounds is relatively high among the respondents of different ethnicities.

## Citizenship - Well-being and everyday life

In the following subchapter the variables of the topic area well-being and everyday life as well as school life are analysed on the condition of citizenship.

Table 106 shows how satisfied the respondents are with their lives, broken down by citizenship. On arithmetic average, it is the respondents with a citizenship other than the Austrian citizenship who are more satisfied with their lives (mean: 4.12 without cit., 4.00 with cit.), who are more likely to like themselves (mean: 4.06 without cit., 3.83 with cit.) and who have more positive prospects of their future (mean: 4.13 without cit., 3.88 with cit.).

Only with regard to the question of whether respondents have what they need in their lives did respondents with Austrian citizenship agree with this statement more often on average (mean 4.48) than those without Austrian citizenship (mean 4.24). Overall, however, these are not significant differences.

Table 107 shows how often and in what way respondents with and without Austrian citizenship spend their free time. With regard to the frequency distributions in the domains "Meeting, playing with friends" and "Using smartphone or computer to stay in touch with friends/relatives," there are hardly any differences in terms of Austrian citizenship. In general, respondents are most likely to maintain relationships with friends and relatives via digital devices on an almost daily basis (approx. 82\%). Students with or without Austrian citizenship meet their friends most frequently once or twice a week (approx. 53\%).

There is a small difference in the probability distribution broken down by citizenship with regard to the frequency with which respondents spend their free time alone. Here, 44.3\% of those with Austrian citizenship say they do so. While the probability is $40 \%$ when it comes to respondents without Austrian citizenship. At the same time, the ratio is reversed when it comes to the probability of rarely or never spending time alone in one's leisure time. Here, more respondents without Austrian citizenship (19.2\%) say they do so than respondents with Austrian citizenship (14.7\%).

The greatest difference is seen with regard to the frequency with which respondents say they participate in organized leisure activities and classes. The probability of doing so is $40.3 \%$ for respondents without Austrian citizenship, which is higher than for respondents with Austrian citizenship, which is $28.3 \%$. For respondents with Austrian citizenship, it is more likely to do this once or twice a week, at 42.9\% (Without Austrian citizenship, 35.3\%), or rarely or not at all, at $\mathbf{2 8 . 9 \%}$ (Without Austrian citizenship, 24.4\%).

With regard to the question of how supportive and attentive the social environment of the respondents is, small differences in the data can be seen depending on whether the respondents have Austrian citizenship or not (see Table 108). Note, these differences are not significant.

On average, respondents with Austrian citizenship state more frequently than respondents without Austrian citizenship that they are supported by their family in difficult situations (mean: 4.38 with cit., 4.29 without cit.) and that they are treated affectionately by them (mean: 4.36 with cit., 4.34 without cit.). With regard to the question whether the respondents have enough friends and whether they are supportive when the respondents have problems, on average more of the respondents without Austrian citizenship agreed (mean 4.46 "enough friends", 4.29 "support from friends") than those respondents with Austrian citizenship did (mean 4.37 "enough friends", 4.23 "support from friends"). However, the differences are negligible and not applicable to the population.

Broken down by citizenship, 54.2\% of respondents with Austrian citizenship often spend time with friends from school in their free time (see Table 109). This is the case for only
46.6\% of the respondents without Austrian citizenship. The ratio is reversed when it comes to whether respondents spend time in their free time with friends who do not go to their school. Here $55.1 \%$ of the respondents without Austrian citizenship answered "yes" and $44.9 \%$ of those who possess such a citizenship.

Relatively rarely do the respondents not meet friends in their free time. Here, at 23.2\%, the respondents without Austrian citizenship are higher than the respondents with Austrian citizenship, $21.4 \%$ of whom stated that they do not meet friends in their free time.

Table 110 shows that respondents with Austrian citizenship are most likely (39.3\%) to sometimes spend time online with friends outside of school online. This differs from the frequency of this type of leisure activity among respondents without Austrian citizenship. Indeed, these respondents are the most likely to report often spending their free time online with friends, at 38.3\%. The likelihood of respondents without Austrian citizenship increases linearly with the frequency with which they spend time with friends online, which is not the case for respondents with Austrian citizenship. At the same time all in all the respondents with Austrian citizenship significantly spent more time online with their friends in their free time than the respondents without Austrian citizenship do.

Table 106-Citizenship × Life satisfaction

## Citizenship - School life

With regard to the question of how often respondents feel good, perceived by the school environment and not overwhelmed at school, there are slight differences broken down by possession of Austrian citizenship (see Table 111). In Both groups the indicated frequencies increased with the temporal frequencies in regard to the questions of how often they feel safe at school, feel they belong to their class and are thus okay with being asked questions by teachers. At the same time, in all categories and without exception, respondents without Austrian citizenship are at least 5.4 percentage points more likely to say they are often satisfied compared to respondents with Austrian citizenship.

This is particularly striking with regard to the last question: "I feel OK what my classmates think of me". Here, the probability of doing this of being a person with Austrian citizenship is $32 \%$. It is more than ten percent lower than the figures for persons without Austrian citizenship, for whom this is often the case at $43.5 \%$. Also, with regard to this question,
persons with Austrian citizenship are more likely to experience this sometimes at school (35\%).

The probabilities of how often respondents like being at school jut out. Here, both groups have it in common that they are more likely to feel this "sometimes" (with Austrian citizenship 36.6\%, without Austrian citizenship 35\%) or "occasionally" (with Austrian citizenship 30.5\%, without Austrian citizenship 32.5\%) than "often" (with Austrian citizenship $15.7 \%$, without Austrian citizenship 23.3\%).

With regard to the answers listed in Table 112, it can be noted in the first place that the frequency distributions in the citizenship groups are similar in all variables except one. There was a small difference in the frequency distribution between respondents with and without Austrian citizenship in the question of how often classmates care about the respondents' feelings. On the one hand, this is most likely to be the case "sometimes" for both groups ("citizenship" 34.5\%, "without citizenship" 30.9\%). On the other hand, fewer of the respondents without Austrian citizenship than those with Austrian citizenship said that the respondents cared about the respondents' feelings "rarely" to $6.4 \%$ and "never" to 8.5\% (citizenship: 12.6\% "rarely", 7.2\% "never").

The variables "My classmates accept me just the way I am", "My teachers accept me the same way as other classmates" and "My teachers listen to me and take what I say into account" were most frequently stated by respondents with and without Austrian citizenship. For all these variables, the frequencies decrease with decreasing points in time. With regard to the statement "My classmates accept me just the way I am", the respondents without Austrian citizenship stated "often" most frequently (59.3\%). Among the respondents with Austrian citizenship it was $52.9 \%$. This relationship continues with the question "My teachers accept me the same way as other classmates", to which $59.6 \%$ of the respondents without Austrian citizenship answered "often". The respondents with Austrian citizenship answered $56.5 \%$ with "often". Likewise, of the two groups, respondents without Austrian citizenship most often feel understood and respected by their teachers (54.6\%).

Both citizenship groups most frequently answered "occasionally" ( $37.1 \%$ "citizenship", $32.7 \%$ "without citizenship") about how often the respondents' teachers talk about different countries, languages, cultures or religion.

In summary, mostly the respondents without Austrian citizenship feel most frequently "often" accepted by teachers and classmates and understood and respected by teachers. Also, when it comes to whether the "classmates care about how I feel" or the teachers talk about diversity, it is the respondents without Austrian citizenship who state more often that this is the case than the respondents with Austrian citizenship, although here the frequency that this is the case is relatively lower for both groups compared to the other variables.

The Table 113 shows how often respondents are excluded from games and activities by their classmates, broken down by citizenship. It can be seen that respondents with Austrian citizenship experience repeated exclusion less often than is the case for respondents without citizenship.

Thus, with a probability of $7.2 \%$, respondents with Austrian citizenship state that they have been excluded by classmates more than three times in a school year. Respondents without Austrian citizenship state this twice as often (15.4\%). At the same time, the probabilities of not being excluded by classmates are similar for both groups. 70.8\% of respondents with Austrian citizenship state that they do not experience exclusion, while $67.5 \%$ of respondents without Austrian citizenship find this true for themselves.

In terms of unfair treatment, it appears that only when it comes to economic status, the citizenship variable influences the unfair treatment variable when it comes to teacher behaviour (see Table 114).

It appears that there is little correlation between the variables "citizenship" and permission to speak another language than German in the school (see Table 115). Also, the probabilities of having permission to speak a language other than German outside of class are similar between respondents with (72.2\%) and without Austrian citizenship (73.7\%). This shows that the probability of being treated unfairly by teachers on the basis of one's own economic status is higher for respondents without Austrian citizenship (7.7\%) than for respondents with Austrian citizenship (2.7\%). It can be seen that students without an Austrian passport are more likely to be treated unfairly by teachers.

The probability of how often speaking a language other than German is initiated by teachers in class, disaggregated by possession of Austrian citizenship, is slightly different (see Table 116). That is, respondents who do not have Austrian citizenship report this more often (54.7\%) than respondents with Austrian citizenship (47.8\%). Respondents with Austrian citizenship state more times that they are not asked by teachers to speak another language in class ( $35.2 \%$ ), as well as they state more often that they do not know (17\%), than the respondents without Austrian citizenship (29.9\% "no", 15.4\% "I do not know").

With regard to the assessment of their own performance, there are differences between respondents broken down by citizenship (see Table 117). While the proportions of respondents in both groups who describe their school performance as poor are similar (with Austrian citizenship 10\%, without Austrian citizenship 12.9\%), the frequencies in the other two categories diverge.

Whilst both groups predominantly assess their performance as average (with Austrian citizenship 55.2\%, without Austrian citizenship 61.2\%), a difference is already apparent here. Respondents without Austrian citizenship are more likely to rate their own performance as average than respondents with Austrian citizenship.

In fact, it is generally more likely to rate one's own school performance as above average if one has Austrian citizenship (34.8\%) than if one does not (25.9\%). We find a discernible tendency for respondents with Austrian citizenship to rate their performance better overall than respondents without Austrian citizenship.

The assessment of the statements in Table 118 differs most between respondents with and without Austrian citizenship when it comes to the question of whether immigrant pupils have the right to cultivate their culture and language. Here, respondents without Austrian citizenship agree on average more often (mean $=4.67$ ) than respondents with such citizenship (mean: 4.42). It also seems that respondents with Austrian citizenship, with mean $=4.60$, are less likely to have classmates with diverse backgrounds in their class than respondents without Austrian citizenship (mean: 4.72). The question of whether pupils of diverse backgrounds get along with each other was answered equally by both citizenship groups (mean: 4.72).

However, the statistical test procedures could not determine any significant difference, which is why the null hypothesis and accordingly no difference between the two groups can be assumed. Having multiple friends who are not from Austria is 17.9 percentage points more likely if respondents do not have Austrian citizenship (65\%) than if they do (47.1\%) (see Table 119).

This difference reverses when respondents were asked whether they have few friends who have diverse national, religious or cultural backgrounds. Here it is the case for $45 \%$ of respondents with Austrian citizenship, and for $28.2 \%$ of respondents without Austrian citizenship. Accordingly, it can be concluded that respondents without Austrian citizenship have a more diverse circle of friends in terms of cultural, religious, and national diversity.

## Religion - Well-being and everyday life

As Table 120 shows, the variable "religion" (see Table 14) was recoded into three domains to make an analysis of the data feasible. The religious data were divided into three categories. This results in the largest group of "Christians" with $44.6 \%$ (see Table 120). The second largest group, at $41.3 \%$, is made up of all other religions, and the last and smallest group is made up of $14.1 \%$ of the sample and includes all respondents who do not consider themselves to belong to any religion.

With regard to questions on general satisfaction with one's own life circumstances, differences in the central tendencies between the religions could be found with regard to the question of whether the respondents like themselves (see table 121). It can be assumed that there are differences in the central tendencies of the groups "Christianity", "Islam, Buddhism, Hinduism, other" and "No religious belief" with regard to the question of whether the respondents like themselves (Chi-square $=6.448, \mathrm{p}=0.04$ ). No such significant differences could be found with regard to the other questions on life satisfaction.

Table 122 shows how often and in what ways respondents of different faiths spend their free time. Significant correlations were found in relation to digital socializing and physically meeting friends. These are analysed below. Respondents who do not belong to any religion are least likely to meet or play with friends once a week to daily, compared to the other religious groups, with a total of 71.7\%.

In the middle on this topic are respondents with "other" religion, with a combined 81.1\%. The probability of physically meeting friends as a Christian respondent is thus highest compared to the other groups, with a combined $88.8 \%$. It can be concluded from this that Christian respondents are most likely to physically meet friends outside of school, followed by respondents with other religions and non-denominational respondents.

In terms of digital contact with friends and relatives, the picture that emerges is that all groups regularly use tools such as smartphones or computers in their everyday lives. The likelihood of daily to almost daily use of such devices is highest among non-denominational respondents ( $90.8 \%$ ). Followed by Christian respondents (84.5\%) and respondents with other religion (73.5\%). As is noticeable, respondents of other religions have relatively less frequent online contact with friends and relatives than respondents who are Christian or non-denominational (21.1\%).

Table 123 shows the arithmetic means of the answers to questions on the topic of support from the social environment broken down by religious affiliation. The differences between the groups are not statistically significant. The most striking tendencies are described below. With regard to support and consideration by the family, it is the non-denominational respondents who rate this highest on average (mean: 4.39 "support", 4.52 "consideration"), with respondents of denominations other than Christian coming in last (mean: 4.32 "support", 4.33 "consideration"). With regard to a sufficient network of friends and support from friends in difficult situations, on average Christian respondents state most frequently that they have this (mean: 4.47 "enough friends", 4.32 "support from friends"). Table 124 shows significant correlations of respondents' religious affiliation with the variables "Outside of school, I often spend time with my friends from outside" and "Outside of school, I do not spend time with friends." Here, in terms of the correlation of often spending free time with friends who are not from one's own school, it appears that this is done by more than half of Christian and non-denominational respondents (51.7\% and 52.3\%, respectively). The likelihood of doing so as respondents of other religions is relatively low at $39 \%$.

Outside of school, the likelihood of not spending time with friends increases when respondents are of a religion other than Christian (29.1\%). The other groups each account for about one-fifth of the respondents (18\% Christian, 20.7\% undenominational).

In Table 125, the relationship between the variable religious affiliation and the variable how much time respondents spend with friends outside of school is weak, with a significance of 0.045 and a Cramer's V of 0.124 . This relationship is described in more detail below. It can be seen that the combined probability of sometimes to often spending time with friends is highest among nondenominational respondents, at 53.8\%, compared to the other religious groups. This is followed by Christian respondents who spend time face-to-face with friends at $51.7 \%$. Respondents with non-Christian religious affiliation are in last place at $43.7 \%$.

Respondents with religious affiliation other than Christian were the most likely to say they "occasionally" spend time face-to-face with friends, at 36.3\%.

The probability of how often another language is spoken in class, divided according to age group, is slightly different (see Table 75). Thus, older students state more frequently ( $46.1 \%$ ) that this is sometimes the case than younger students do (35.1\%). At the same time, the frequency of students indicating the other domains saying that they do not speak another language in class, or that they do so often, or that they do not know, differs by only about 5\% between the age groups, which shows little difference between the age groups.

The distribution of the probability of how well the respondents assessed their performance in comparison to their classmates divided by age group membership is similar to the overall distribution of the probability of how well the respondents assessed their school performance in comparison to their classmates (see Table 76). In terms of differences between age groups, it can be noted that the percentage of students who rate their performance better than average is slightly higher among older respondents (32.\%) than among younger ones (28.7\%).

Table 77 presents how respondents find and feel about cultural, religious and linguistic diversity in their school, broken down by age group. It shows that there are significant differences between the age groups when it comes to the question of how much they like having pupils from diverse backgrounds in their class ( $U=21779.000, p=0.037$ ). It is also valid to say that there is a significant difference between the age groups in terms of whether students from diverse backgrounds get along well with each other in their class ( $U=$ 21813.000, $p=0.038$ ).

The probability of having many friends from different countries if the respondents belong to the younger age group is $49.1 \%$. Comparably, slightly more than half of respondents in the older age group (52.8\%) report having many such friends (see Table 78). The probability of having a few foreign friends is slightly higher (45.1\%) if respondents belong to the younger age group than if they belong to the older group (38.8\%). The probability of having no foreign friends is low in comparison, whether respondents are older or younger.

Religion - School life
In Table 126, there are significant associations between religious affiliation and the variables "I like being in school" and "I am OK when a teacher asks me a question." This relationship is described in more detail below. When asked how often respondents like to be at school, the most likely answer for all (non-) religious groups is "sometimes," indicated by $35.4 \%$ of respondents with a non-Christian religious affiliation, $35.9 \%$ of nondenominational respondents, and $38.9 \%$ of Christian respondents. In general, respondents who are of a religion other than Christianity are most fond of school ("often" 28\%). Of the groups, it is those with no religious affiliation who are least likely to like being at school (10.9\%). In terms of whether respondents from the various religious groups feel it is okay to be asked questions by teachers, all groups are most likely to feel this way "often" (Christians 46.3\%, Others 48.7\%, Non-Denominational 43.8\%). At the same time, among the religious groups, the non-denominational respondents seem to be the ones who least like being asked by teachers ("never" 9.4\%).

In Table 127 the subject of the frequency of good relationships among the pupils in the classes as well as attentiveness of the teachers disaggregated by religious affiliation is listed. With regard to the variable "My classmates care about how I feel," a significant correlation was found for the population. This relationship is described in more detail below. In general, compared to the other variables on well-being at school, it is less frequently the case that students indicated "often" on this variable. Thus, for one-third of respondents with non-Christian religious affiliation, it is "often" the case (31\%) that they experience the compassion of their classmates. The other two religious groups are below that. Among them, the most common response was that their classmates "sometimes" care about the respondents' feelings (37.4\% Christian, 28.6\% Non-Confessional).

Confessionless respondents were especially likely to indicate that they rarely to occasionally feel empathized with by their classmates. The correlation is small with a significance level of $p=0.0158$ and a Cramer's V of 0.158.

Table 128 lists, by religious affiliation, how often respondents experienced exclusion, bullying, or physical violence by their classmates in the last school year. Physical violence (range $81.3 \%$ to $75 \%$ ) is experienced least often by all respondents, followed by exclusion (range $69.3 \%$ to $68.8 \%$ ) and bullying (range $56.3 \%$ to $45.9 \%$ ). This suggests that physical violence tends to be rare in everyday school life, although at 18.8\%, about one-fifth of nondenominational respondents say they have experienced it at some point during the school year. Furthermore, it is noticeable that the probability for respondents with a non-Christian religious confession to have experienced bullying more than three times during the school year is high at $21.9 \%$ compared to the other groups (Christians $15.7 \%$, non-denominational $12.5 \%$ ). Apart from this difference, no (non-)religious group can be identified that experienced exclusion or physical violence significantly more often in the last school year.

When asked whether respondents were treated unfairly by teachers on the basis of various nominal characteristics, significant differences emerged between the different religious groups in the frequency responses to "Your gender" and "Where you live" (see

Table 129). These are analysed in more detail below. Unfair treatment by classmates could not be found. Thus, at $49.9 \%$, respondents without a religious confession stated more than twice as often that they had been treated unfairly by their teachers on the basis of their gender as Christian respondents (23.91\%) and respondents with a different religious confession ( $22.36 \%$ ). Overall, respondents of different religious denominations were very rarely treated unfairly by teachers because of their place of residence, although here the frequency figures did not differ all the same. Here, respondents of a denomination other than Christian experienced unfair treatment by teachers more often (6\%) than the other two groups did (1.50\% "Christians", 1.60\% "No religious affiliation"). In summary, it appears that non-denominational respondents are most likely to be treated unfairly by teachers because of their gender and that respondents of religions other than Christian are treated unfairly by teachers in relation to their place of residence.

One explanation for the first finding could be that different treatment on the basis of gender is perceived as more normal, and accordingly not unfair, for religious respondents on the basis of their faith than it is for non-believing respondents. In any case, religious affiliation has an influence on whether respondents feel unfairly treated because of their gender and place of residence. Looking at Table 130, it is noticeable that the likelihood ratio in the group with a non-Christian denomination is highest (35.9\%) when it comes to whether they are allowed to speak a language other than German outside of class at school.

This is followed by respondents with a Christian confession, who state this with $25.2 \%$. Confessionless respondents are the least likely to state that they are forbidden to speak a language other than German outside of class (17.5\%). In short, speaking a language other than German at school is forbidden for one-third of respondents with a denomination other than Christian. Thus, having a non-Christian denomination and speaking another language seems to be the most undesirable by the schools.

The assessment of how often respondents, broken down by (non-)religious groups, have the opportunity to speak a language other than German in class varies (see Table 131). Respondents with a non-Christian religious affiliation most frequently state that teachers do not speak any language other than German with them, at 38\%. Christian respondents share this assessment by 4.8 percentage points less, at $33.2 \%$. This is closely followed by nondenominational respondents, who state this with 29.7\%. Respondents of non-Christian confession thus seem to be least likely to be motivated by their teachers to speak a language other than German.

How nondenominational respondents rate their academic performance compared to their classmates diverges most when compared to the other two religious groups (see Table 132). While they are most likely to rate their academic performance as above average at $42.2 \%$, $18.8 \%$ of them also report a poorer performance then average. Christians among respondents are overwhelmingly likely to rate their performance as average (57.6\%), though one-third (33.5\%) of them are still more likely than respondents with a non-Christian denomination to rate their performance as above average (non-Christians 26.1\%).

## CREATE

Respondents with a non-Christian religious affiliation rate their academic performance mostly as average compared to the others (62.2\%). Significant differences in central tendencies in the response behaviour between the religious groups were found with regard to the statement that migrant pupils have a right to practise their culture, language and religion and that there are pupils of different cultural, religious and linguistic backgrounds in their own school class (see Table 133).

Respondents with a non-Christian denomination are most likely to have several friends with different cultural, religious or regional backgrounds (64.3\%) (see Table 134). Thus, they are most likely to indicate this option compared to the other religious groups. Respondents who belong to a Christian denomination or are non-denominational are most likely to have several friends with various backgrounds (Christians 48.3\%, non-denominational 50\%).

It can be concluded that there is a weak but significant relationship between the variables "religious affiliation" and "number of friends with different backgrounds"

## Socio-economic status - Well-being and everyday life

As can be seen in the Table 135, with 78\%, the majority of the sample has "some difficulties to cover economic necessities" in their family. While on the one hand $15.2 \%$ of the respondents state that they have a family without economic difficulties, on the other hand $6.8 \%$ of the sample have considerable problems meeting the economic constraints within the family. Hereafter, the variable that summarises these characteristics is called "socio-economic status".

With regard to the question of how the respondents perceive their living situation, differentiated by socio-economic status, no significant different tendencies in the response behaviour could be detected (see Table 136). It was noticeable that respondents with severe socio-economic problems agreed on all questions less frequently on average than respondents with few or no socio-economic problems. For example, with regard to the question whether they like themselves, they state this with a mean $=3.10$ much less frequently than respondents with some (mean $=3.94$ ) or no (mean $=4.08$ ) socio-economic difficulties.

In Table 137 respondents indicated how they spent their leisure time. Broken down by socio-economic status, it can be seen that respondents with major economic problems meet friends, take part in organised leisure activities or extracurricular classes, or maintain contact with friends and relatives via digital devices less frequently than the other two groups. In the former category, this tendency is well explained by the socio-economic possibilities of the respondents' families ( $42.2 \%$ "rarely or never"), as participation in organised leisure activities often costs money. The same applies to the last category of the use of digital devices, which can be expensive to buy and thus to use. As a result there may be fewer of these devices in socio-economically weak families, which in turn could make frequent use more difficult in contrast to the other two groups. The extent to which severe socioeconomic problems cause friends to be met less often in their free time ( $21.2 \%$ "rarely or never") is less easily explained. This may also be due to the fact that the small number of cases in the group distorts the statistics.

Respondents with some socio-economic difficulties are most likely to maintain daily to almost daily digital contact with their friends and relatives (82\%), closely followed by respondents without socio-economic difficulties (79.7\%). Friends are also most frequently met daily to almost daily by respondents with some socio-economic problems in their free time (33.8\%), followed by respondents with no socio-economic problems (52.7\%). This latter group dominates in terms of the frequency with which respondents participate in organised leisure activities (36.5\% (almost) daily).

With reference to Table 138, no significant different trends in the response behaviour of the different socio-economic status groups could be identified in relation to questions around the respondents' social environment. Accordingly, there are no acceptable differences in the assessment of how well respondents of different religions are socially connected and supported. In terms of the sample, there are small non-significant differences, such as that respondents with severe socio-economic difficulties were on average less likely to agree with all statements than the other groups. Thus, on average, they have the least support (mean $=4.00$ ) and perception (mean $=3.59$ ) from their family, fewer friends (mean = 3.75) who are also there when they have problems (mean = 4.00). However, these statements are not generalisable.

With regard to the question of whether respondents frequently spend their leisure time with friends face-to-face or online, broken down by socio-economic status the frequency increases with the socio-economic status of the respondents, according to Table 140. The difference is particularly large with regard to the time respondents spend online with friends. Here, respondents without socio-economic difficulties are the most represented with $40.5 \%$, followed by respondents with some financial difficulties (35.5\%). Respondents with severe socio-economic difficulties spend only $21.2 \%$ of their time online with their friends.

Respondents in all groups say they are most likely to spend face-to-face time with friends outside of school sometimes. Again, respondents without socio-economic difficulties
dominate (37\%), followed by those with some financial problems (34.4\%) and lastly those with severe financial difficulties (32.3\%).

The social isolation caused by the corona lockdowns in Austria might have had an influence on why respondents rarely meet friends frequently overall. When looking at the data, some differences become noticeable. For example, it can be seen that the frequency distributions within the groups of different socio-economic status are similar in relation to whether respondents often spend time with friends from school and not from school. With regard to friends from school, $52.1 \%$ of respondents with no socio-economic difficulties, $52.2 \%$ of respondents with some socio-economic difficulties and $36.7 \%$ of respondents with many socio-economic difficulties indicated this. The distribution is similar with regard to friends who do not come from the same school. Here, $46.6 \%$ of the respondents without socio-economic difficulties, $49.3 \%$ of the respondents with some socio-economic difficulties and $27.3 \%$ of the respondents with many socio-economic difficulties stated that they often meet them outside school.

The distribution of the frequencies of who do not meet friends outside school is distributed differently among the different socio-economic groups. Here, those who have a lot of socio-economic difficulties dominate with $55.6 \%$, followed by respondents without socio-economic difficulties with $25.8 \%$ and those with some difficulties with $19 \%$. In summary, it can be seen that respondents with a lot of socio-economic difficulties see their friends less than respondents with no or some difficulties.

## Socio-economic status - School life

With regard to the question of whether the respondents feel good at school with regard to different aspects, there are greater differences divided according to socio-economic status (see Table 141). The likelihood of often or sometimes being comfortable at school, feeling part of one's own class and having the feeling of being accepted by one's classmates increases strongly with the respective socio-economic status of the respondents.

For example, the likelihood of liking to go to school often to sometimes is at least twice as high for respondents with no or mild socio-economic difficulties ("often" + "sometimes": $63.5 \%$ "no difficulties", $54.4 \%$ "some difficulties") as it is for respondents with major socioeconomic difficulties ( $25 \%$ "often" + "sometimes"). A similar relationship can be seen in relation to the feeling of belonging to one's own class, as well as in relation to "I feel OK what my classmates think of me". In summary, it can be said that the extent to which a student feels comfortable at school is weakly to moderately associated with that person's socio-economic status.

In Table 142 the subject of the frequency of good relationships among the pupils in the classes as well as attentiveness of the teachers disaggregated by socioeconomic status is listed. Four out of five variables in this topic associate significantly with the variable socioeconomic status.

Respondents with mild socio-economic difficulties are most likely to feel accepted by classmates (58\%), empathically empathised with (27.9\%) and noticed by teachers (51.7\%) compared to the other socio-economic groups. Respondents without socio-economic difficulties are a close second. Far behind are those with severe socio-economic difficulties. These respondents are only around half as likely as those with mild socio-economic difficulties to say that they often feel accepted by classmates (30\%) and empathically
empathised with (8\%) and that they are often noticed by teachers ( $25.8 \%$ ). Having many socio-economic difficulties has a negative effect on respondents' relationships with their classmates and teachers.

Table 143 shows the probability of not having been bullied, physically attacked or excluded by classmates one or more times this school year, broken down by socio-economic status. The variable bullying and socioeconomic status are weakly but significantly associated at Cramer's $V=0.167$. For respondents with mild socioeconomic difficulties, the probability of not having been bullied or having been bullied one to several times in the past school year is fifty-fifty (50.4\% "never").

This means that these respondents are least likely to have been bullied, in contrast to respondents without socio-economic difficulties (40\% "never") or severe socio-economic difficulties ( $36.4 \%$ "never"). This relationship is also reflected in the variable "physical violence", which respondents with mild socio-economic difficulties experienced less often in the past school year ( $83.3 \%$ "never") than respondents without or with severe socioeconomic difficulties (both about $72 \%$ "never").. This difference fans out particularly strongly in relation to experienced exclusion by classmates. While $72.5 \%$ of respondents with mild socio-economic difficulties have never experienced exclusion, 64.3\% of respondents without socio-economic difficulties have never experienced exclusion, followed by respondents with severe socio-economic difficulties (54.8\%).

Thus, it can be seen that respondents with severe socio-economic difficulties have the highest probability of being bullied, beaten or excluded by classmates. Respondents with mild socio-economic difficulties, on the other hand, are most likely to be spared such violence. The likelihood of being treated unfairly by classmates in relation to the respondents' gender is higher the worse their socio-economic status is (see Table 144). Thus, $14.3 \%$ of respondents without socio-economic difficulties reported this, while $15.7 \%$ of respondents with mild socio-economic difficulties and over a quarter ( $25.8 \%$ ) of respondents with severe socio-economic difficulties indicated it.
. Interestingly, $22.6 \%$ of respondents without socio-economic difficulties said they had been treated unfairly by teachers because of the language they speak, making them the strongest on this point. They are followed by respondents with severe socio-economic difficulties (20\%). In last place are respondents with mild socio-economic difficulties, only $10 \%$ of whom said they were treated unfairly by teachers because of their language knowledge.

Table 145 shows that the higher the socio-economic status of respondents, the more likely they are to speak a language other than German at school outside of class hours. Thus, $65.6 \%$ of respondents with severe socio-economic difficulties report having such permission, while this is proportionately more common with $71.6 \%$ of respondents with mild socio-economic difficulties and $73.9 \%$ of respondents without socio-economic difficulties.

When it comes to the question of whether respondents are encouraged by teachers to speak a language other than German in class, this is more often the case for respondents without socio-economic difficulties ( $14.3 \%$ "often") than for respondents with mild or severe socio-economic difficulties (both $6.1 \%$ "often") (see Table 146). Interestingly, respondents with severe socio-economic difficulties were relatively more likely to say they did not know the answer.

When respondents were asked to rate their scholastic performance in relation to their schoolmates, the higher the socio-economic status, the better it was rated (see Table 147). Thus, $38.6 \%$ of the respondents without socio-economic problems stated that they performed better than average, while this was the case for $30.6 \%$ of the respondents with slight socio-economic difficulties and for $25.8 \%$ of the respondents with severe socioeconomic difficulties. Conversely, the worse one's socio-economic status, the more often one's performance was rated worse than average ( $2.9 \%$ no socio-economic), $12.1 \%$ mild difficulties, $16.1 \%$ severe difficulties). All three socio-economic groups rated their school performance as average (approx. 58\%). With regard to agreement with various statements about diversity in Austria and the school, no significant different tendencies could be found in the three socio-economic status groups. Although differences are visible in Table 148, these cannot be generalised accordingly.

To briefly describe the descriptive statistics, it can be stated with regard to all three statements that respondents with few socio-economic difficulties are most likely to agree with them on average compared to the other groups (mean: 4.49 "right to practise once own religion etc.", 4.68 "diverse school class", 4.74 "no conflicts"). In second place come those respondents with strong socio-economic difficulties (mean: 4.43 "right to practise once own religion etc.", 4.66 "diverse school class", 4.56 "no conflicts") and finally the respondents without any socio-economic difficulties (mean: 4.25 "right to practise once own religion etc.", 4.35 "diverse school class", 4.58 "no conflicts").

As can be seen in Table 149, the number of respondents with friends with diverse religious, cultural and regional backgrounds increases the more socio-economic difficulties they face. Thus, $47.1 \%$ of respondents with no socio-economic difficulties, $51.9 \%$ of respondents with mild socio-economic difficulties and $56.3 \%$ of respondents with severe socio-economic difficulties report having several friends with diverse backgrounds. Finally, $42.9 \%$ of respondents with no socio-economic difficulties, $41.1 \%$ of respondents with mild socio-economic difficulties and $34.4 \%$ of respondents with severe socio-economic difficulties report having few friends with diverse backgrounds.

## 4. Conclusions and discussion

Summing up the demographics the average respondent is 14.5 years old, female, speaks German fluently, was born in Austria, has an Austrian citizenship, is religiously affiliated and lives in an urban, diverse neighbourhood. In terms of family, the average respondent has at least one parent who was not born in Austria and lives with his/her family, which is most likely struggling a bit economically.

The respondents' overall well-being appeared to be high, and they generally could rely on a supportive social network. Furthermore, it was most likely that the respondents spent their leisure time online, which might be explained by the special circumstances of the COVID-19 pandemic. Significant differences were found in the sample in relation to age, ethnicity, citizenship, and religion.

When breaking down the questions on well-being and everyday life by age, the most interesting and important findings were that younger respondents tended to be more positive about their future and more satisfied with their lives and felt more supported by their families than older respondents. Contrary, the older the respondents were, the more time they spent with friends instead of spending it on their own, and they had a more homogenous circle of friends which was mostly centred around school.

In terms of ethnicity, respondents with former Yugoslavian ethnicities were found to be the most active when it came to participating in organised recreational activities. They as well were the most likely to keep in touch with friends and family via digital devices compared to respondents of other ethnicities. The least active ones in these fields were respondents of European and Asian ethnicities.

With respect to citizenship and everyday life, there was a significant connection found between citizenship status and the way how friends were met. Thus, it turned out that respondents in possession of an Austrian citizenship were more likely to meet their friends online whereas respondents without such citizenship most probably met their friends face-to-face.

Divided by religious affiliation, Christian respondents were the ones that were most likely to meet friends in their leisure time compared to respondents without religious affiliation and respondents of other religious denomination. Together with the non-denominational respondents they were also significantly most likely to meet with friends in their free time, that did not visit the same school as they do. The likeliness of not meeting friends in their free time was highest among respondents of non-Christian affiliation. Finally, respondents who were not religious appeared to be most frequently in touch with friends and relatives online and most likely to meet their friends in person.

When asked how respondents experience their school life, it was found that school attendance, relationships with classmates and teachers were generally most often perceived as pleasant.

Significant differences were found in the sample in relation to age, religion, and socioeconomic status. Younger respondents were significantly more likely to enjoy being at school and to feel more considered by their teachers than their older peers. Being at school as well as being asked questions by teachers was perceived significantly most positively by respondents with non-Christian denomination. Furthermore, it was most likely to be of this group and feel cared for by one's classmates. In contrast, for the respondents of no religious denomination it was significantly least likely to feel positive about these categories.

The likelihood of often or sometimes being comfortable at school, feeling part of one's own class and having the feeling of being accepted by one's classmates increased strongly and significantly with the respective socio-economic status of the respondents. In short, the more socio-economic difficulties a respondent had the worse his*her relationship with classmates and teachers were.

Overall, discrimination was rarely experienced by the respondents and if it was, it was most probably related to gender, nationality, or race. When analysed along nominative categories, following findings on this topic were significant.

Age played an important role when it came to experiencing unfair treatment at school. The older the respondents were, the more likely they were to say that they had been treated unfairly by teachers because of their nationality, race, language, religion, and gender. Furthermore, being girl was associated with a higher likelihood of unfair treatment, as girls seemed to be bullied significantly more often by classmates than boys. Correspondingly, it was found that girls were treated unfairly by their teachers significantly more often than boys because of their nationality and race.

Unfair treatment because of one's economic status was significantly more likely if the respondents did not possess an Austrian citizenship. They also were more likely to have had experienced exclusion by their classmates than respondents who had got an Austrian citizenship.

Divided along religious affiliations experiencing unfair treatment by teachers because of one's gender was most likely for respondents without religious affiliation, whereas unfair
treatment based on one's place of residency was most likely for respondents of nonChristian denomination. Additionally, respondents with non-Christian religious affiliation dominated when it came to the prohibition of being allowed to speak a language other than German at school.

Finally, it was found that a respondent' socio-economic status had an influence on experienced unfair treatment as well. Hence, the probability of unfair treatment by teachers in relation to gender increased the worse a respondent's socio-economic status was. The same was found to be the case for experienced exclusion, bullying and physical violence by classmates. While respondents without socio-economic difficulties were the ones that significantly most frequently reported to be encouraged by their teachers to speak another language in school, they were also the ones that most frequently felt treated unfairly because of the language they speak.

In terms of diversity and school life, it was identified that, contrary to the finding that respondents generally were in favour of actively living diversity as they were used to a diverse neighbourhood and circle of friends, it was rarely part of the school curriculum.

Interestingly, girls reported significantly more often than boys that teachers dealt with the issue of diversity in class. Why this was the case could not be explained based on the existing data.

Broken down by age, older respondents significantly felt more often accepted by their classmates. Compared to younger respondents they were also significantly more positive about the presence of students from different backgrounds in their class and more likely to report getting along well with diverse classmates. With respect to varying ethnicities, it was found that respondents of Easter European and former Yugoslavian ethnicities were significantly more likely to be spoken to in another language or asked to speak in another language during class, than other respondents of Western European and Asian ethnicities were. In opposition to respondents of Christian faith, respondents of non-Christian faith were most likely to have friends with diverse backgrounds.

The main findings regarding the leisure habits of the sample are as follows: While there was a general tendency to feel good about one's life, age played a significant role. The younger the respondents were the more positive they felt about life. While leisure time overall was most likely to be spent online, the older respondents without Austrian citizenship met with friends more often in their leisure time than their peers. The most socially active respondents in terms of frequently meeting friends were the ones who did have no religious affiliation. Having online contact with friends and family was most likely for respondents with Austrian citizenship as well as respondents of former Yugoslavian ethnicities. Moreover, the latter group was the most likely of all ethnic groups to participate in organised leisure activities.

While school attendance as well as the relationships with classmates and teachers was overall perceived as pleasant by the sample, it was experienced most positively by younger respondents with non-Christian denomination and no socio-economic difficulties.

Furthermore, whereas experiencing unfair treatment by teacher and classmates was unlikely overall, older, female respondents without Austrian citizenship, of no or non-Christian denomination experienced unfair treatment by teachers as well as by classmates significantly more often than their peers. Additionally, the impact of a particular socioeconomic status on the likelihood of unfair treatment by teachers varied depending on what the unfair treatment targeted. Unfair treatment by teachers based on language skills was most likely to be experienced by respondents without socio-economic difficulties, while unfair treatment based on gender was most likely to be associated with respondents with difficult socio-economic status.

Finally, with respect to diversity, the respondents who were older, belonged to an Eastern European or former Yugoslavian ethnic group and were not of Christian denomination were exposed to the topic of diversity the most as well as they lived diversity the most.

## Newly arrived migrant children

The group of "newly arrived" respondents, meaning that they moved to Austria less than three years ago, was the smallest group. A possible explanation could be that potential members of this group might not yet had found their way into the school system respectively that they might be preoccupied with the bureaucratic side of entering the Austrian school system. Another reason might be connected to weaker migration dynamics in the last three years. Additionally, it was found that the "newly arrived" respondents tended to be part of the older age group ( 14 to 19 years). This might be a further reason why they are underrepresented in the sample, since they might have chosen another course of education. Furthermore, this finding might be explanatory for the fact, that the few respondents that did not live with their families were most likely "newly arrived". The characteristic of having moved to Austria recently was significantly associated with the finding, that respondents of this group tended to not have an Austrian citizenship. An important underlying reason for this could potentially be found in tedious naturalisation procedures of the state Austria.
"Newly arrived" respondents tended to be of Christian faith. They also appeared to have stronger family ties in terms of where they could find support if needed. A reason for why the family played a more important role might be found in the result, that "newly arrived" respondents in comparison to the other two arrival groups were less likely to spend time with friends face-to-face which means by implication that they might have more time to bond with their families.

The variable "newly arrived" and the respondent's level of German language skills were also related, meaning that newly arrived respondents were least likely to have good German language skills. This finding is accompanied by the result that "newly arrived" respondents were most likely to be allowed to speak a language other than German outside and inside school class. While the general probability of being treated unfairly is low, "newly arrived" respondents were the ones that most likely reported to be subject to unfair treatment by teachers based on their language skills. Finally, the shorter a respondent lives in Austria, the
more positive the own school life is perceived, meaning that »newly arrived« respondents tended to complain least about how they were treated in and how they felt about school.

## Long-term migrant children

The group of "long-term" respondents, meaning that the moved to Austria more than three years ago but haven't been born in Austria was the second biggest group after the "local" respondents who were respectively born in Austria. For this group together with the "newly arrived" respondents, the chance was higher to have no parent who was born in Austria.

They were also less likely to have an Austrian citizenship and good German language skills than the group of "local" respondents. The explaining factor here might be similar to the one for the "newly arrived" respondents above, and might be found in tedious naturalisation procedures of the state Austria.

Furthermore, this group was more likely to be of Muslim denomination than the other two groups. A possible explanation might be found in the history of which countries were most likely to be migrated from in the last years. Finally, in comparison to the "local" respondents, the "long term" respondents were more likely to be allowed to speak a language other than German inside and outside of class, but least like to have such a permission in comparison to "newly arrived" respondents.

## Local children

The third category consisted of the "local" respondents and makes up the biggest group. The members of this group tended to be the youngest in comparison to the other groups. This might be explained by the fact, that they might have less bureaucratic obstacles to enter school as well as they were more likely to be able to follow the classical Austrian course of education. Furthermore, "local" respondents were most likely to have at least on parent who was born in Austria as well. Additionally, they were also most likely to be in possession of an Austrian citizenship, which might be explained by the specific Austrian naturalization laws that grant the Austrian citizenship as soon as a person has an Austrian parent. A potentially self-explanatory finding was that "local" respondents were most likely to have very good German language skills. At the same time, they were the group that was allowed scarcest to speak another language than German inside and outside of class. Like the "newly arrived" respondents the group of "local" respondents was most likely of Christian denomination. Contrary to the "newly arrived" group, the family was not perceived as supportive as the personal circle of friends. Meaning that the network of friends was significantly more important for the "local" respondents if they needed support than their families were. Finally, it could be found that respondents, who were born in Austria were mor critical of their school and experienced it less pleasant, than respondents not born in Austria did.

In summary a few general and significant tendencies could be identified in relation with the variable "migrant status" of the respondents within the sample. The longer a respondent had lived in Austria, the more likely it was to be younger, to live with one's own family and to have at least one parent who was born in Austria as well. Furthermore, with increasing length of residence, the probability of having Austrian citizenship as well as the German language skills increased, while it became less likely to get permission from teachers to speak a language other than German outside and inside the classroom. Finally, with increasing length of stay, family ties became weaker while the friend network became more important for support, at the same time as school life was perceived less positively.

## 1. Introduction

This report is a result of the analysis of the survey research that was conducted in six schools selected for the in depth study by the Polish research team. There were three primary schools included in the study, two secondary schools and one dormitory house for teenagers attending to different schools in Krakow metropolitan area. As the projects required, survey had been conducted among local children and children with a migrant background in order to examine the attitudes and opinions of pupils toward cultural and religious pluralism, otherness, intercultural communication, intercultural conflicts, migration, migrants, integration, etc. The survey collected also information about their school success, inclusion in peer group, sport, leisure activities etc. The analysis of quantitative data bellow consider variables such as gender, age, ethnicity, religion and languages spoken.

There were two schools - one primary and one secondary where almost half of the total number of surveys were completed with the balanced number of surveys made in each of these schools. Next three schools also delivered balanced number of surveys and only one school - the primary did not complied with the request of the study delivering surveys filled in only by foreigners attending ( 11 in total).

After describing the methodology of the survey research results of the survey are presented followed by their analysis according to demographic variables: age, gender, ethnicity, citizenship, religion and socio-economic status. At the end of this report a summary is providing containing the commentary on the results of the survey.

As we will be presenting, the quantitative study will not provide much contribution to the overall results of the Micreate study as the results acquired during the survey performance show no significance differences between local children and migrant children regardless of the length of their stay in Poland. This conclusion will be however interesting point of reference in the comparative study between six countries involved in the research.

## 2. Methodology

The surveys were conducted between April and November 2020. This period is covered by the state of epidemics due that was proclaimed on the territory of Poland by the national government to SARS-CoV2 virus outburst. This state had not been revoked until the reporting period. During the survey collection restrictions imposed on citizens and institutions differed between the spring, summer and autumn. In the earliest period a full lock down had been introduced and the schooling was entirely remote. This lasted until midMay where a hybrid education had been introduced allowing presence in the school for exams consultations and possibility to conduct regular school classes for the lowest grades. Schools were reopened in September however due to rapid rise of infections they were closed again in October and remained closed until all surveys were completed.

This unexpected factor prompt the decision to conduct the whole research only remotely. All the surveys were though conducted online through a linked website to which participants were logging in. The links and web tool were provided by the ZRS - a project leader. Each school were identified by unique link so the numbers of surveys made in each school were easy to identify.

The principals of each school were first approached by the research team in reference to the survey conduct in January 2020. All headmasters that time approached research with enthusiasm assuring the full cooperation. According to Polish legal and ethical academic regulations concerning this type of research there was no need to collect individual consents for the participation in the survey from parents of the participating student. A general consent given by the school headmaster was enough to conduct the survey research. At first there was a plan to do survey during classes with the presence of the researcher however this idea had been abandoned due to the development of Covid-19 emergency. Having the general consent given by each school management researchers were directed to certain
teachers to communicate with them on participants' recruitment. We believed that the best option to perform the survey would be to connect it with computer science laboratories in each school and some of the schools followed such patterns but other took a different approach and were sending invitation links via Librus or electronic journals - tools designed for communication with students' parents. The state of epidemics and remote model of education significantly lengthened the period of the data collection and required extra logistical effort on behalf of the research team. Teachers selected as a contact reference points needed to be frequently bothered, almost stalked in order to achieve the progress of the survey performance. This was caused not only by lack of direct contact but also by overwhelming number of additional duties resulted from the online education reality. The ongoing contact and convincing arguments used by researcher enabled to exceed the total number of surveys required (540) in the project proposal reaching 598 of completed surveys. As it was said not all schools reached however the required number of 90 surveys completed per school. Only four schools did it, one was lacking only few surveys but one primary school failed in research. This was caused by reluctance of the headmaster to comply with research requirements during the state of epidemics. The headmaster also underlined that the survey itself is not adjusted to local children and for that reason he will not encumber Polish students with such additional work in the stressful period of homebased education. As a result the surveys were completed only by foreign born students attending to this school (11 surveys).

The survey were made online with the use of the link provided separately for each school. The survey began with the choice of its language which in case of Poland were: Polish, English, Spanish, Russian and Ukrainian. At first participants were asked to provide basic demographic data including age, gender, nationality, spoken language, Polish language proficiency, country of birth, family relations, religious affiliations, and conditions of living. After that we have been asking about the different factors of social functioning including identity building, self-confidence and satisfaction in life. We were asking also about sociability, social interactions with peers and teachers as well as evaluation of the school life. A certain questions were directed on assessment of possible experiences of violence, bullying or discrimination. Final questions related to certain indicators of interculturalism. Most of the questions were a closed one, including those which required grading, usually at the fifth-grade scale. Open questions were related to personal beliefs, ethnic origin and nationality or citizenship factors.

Included in the analysis were all the surveys that were completed (not for example exited in the middle) and in which at least $75 \%$ of the questions were answered.

## 3. Results

What follows is the presentation of main findings from the quantitative research in Polish primary and secondary schools.

### 3.1 Sample population

## Demographic data

In the study cohort younger children and girls were dominating. Children between 12 and 15 were constituting $47.6 \%$ of the all respondents. However the older group of children as defined by the project criteria (14-20 against 9-13) reached almost two thirds of the cohort (Table 2). Girls constituted 60.1\% of the study group (Table 2), however in the younger group gender proportion was more balanced (Table 4). Another interesting factor is connected to non-binary identification which was mentioned by 13 respondents, including 11 girls (Table 3). Most children speak in home in their mother tongues however there are significant number of children (6.8\%) who are bilingual. It is also worth to mention that despite low number of children who are Russians Russian language is the most frequently spoken among foreign languages. It must be though spoken by Ukrainians and considered as their mother tongue (Table 5).

Apart from local children that dominated the study group only Ukrainians represented another large national minority (Table 6). Representatives of other nations were singular and only two persons declared to be ethnic minority, particularly Romani one. Almost all respondents declared excellent or good command in Polish (Table 7). Over three quarters have been also born in Poland (Table 8). This group is almost matching the local children cohort $-0.5 \%$ of difference, which is equal to two persons. Another additional $1.5 \%$ difference ( 6 persons) have Polish citizenship (Table 11). From those who were born abroad the dominant group represent Ukrainians (18.6\%) while the representatives of other nations are singular. There were also three Italians and two respondents from Czech Republic, Spain, USA and Great Britain (Table 9). Respondents' distribution according to the project's groups was as follows: local children: 78\%, newly arrived children: 15.5\%, long term migrants: 6.5\% (Table 10).

The relation between citizenship and gender shows that among respondents who were Polish, girls dominated while in case of foreigners there was a gender balance (Table 12). The age variable analyzed by project's defined groups shows that those without Polish citizenship are rather older ones (Table 13). There are also some foreign-born children who have Polish parents, which was derived from the data analysis (Table 14).

Half of the surveyed children declare as Christians (Table 15) which is much lower comparing to the affiliations of adults that is stable high for the past two decades (91-96\%) (CBOS 2020: 2). Almost 22\% declare no religious affiliations and another quarter do not know or do not want to declare it. This might be a clue for laicization of the younger generation.

Due to the specifics of the study most of the children are living in large city or the metropolitan towns and villages surrounding it (Table 16). Also majority like living in Poland (Table 18). Most of them are living with the members of their family and only one per ten does not (Table 20).

Most kids would not justify if the area of their inhabitance is culturally and ethnically diverse, however more children (36\%) see this place as intercultural one than not (Table 17). Children that took part in the study in their majority perceive their economic status as equal to their peers. Each tenth feel however more or less-endowed from their peers (Table 19).

When asked this question only $18 \%$ of children responded positively usually naming several countries they would like to live in. From these choices we may distinguish United States, Great Britain, Switzerland, Austria, Spain, Germany, Canada, Scandinavian counties, Benelux countries, Japan and South Korea. Several children make political expressions criticising government and declaring to live any other country than Poland which was described as backward, "treating LGBT people like shit", not having good government, intolerant and disrespectful, land where there is impossible to decide about oneself.

## Well-being and everyday life

The survey's answers related to questions: "I am completely satisfied with my life", "I have what I want in life", "I like being the way I am" and "I feel positive about my future" we respectively interpreted as indicators of life satisfaction, life control, self-acceptance and
attitude to furure. Here, most of children are also generally satisfied in their lives (56.5\%), having control over it (53.8\%), accept themselves (59.1\%) and positively look forward (61.2\%) (Table 21).

The apprehensive conclusion of the study is that almost all kids are using smartphones or computers to contact with their peers and relatives ( $82.5 \%$ do that everyday) while only $36.9 \%$ prefer direct contact with the same frequency. It might be also disturbing that 38.9\% of children spending time alone each day. Social isolation and lack of social relations are often linked to depression and other emotional distress (Table 22).

Children who were respondents generally feel socially secured. $84.1 \%$ may count on their family support, and $70.6 \%$ are heard by their families that took their will into account. Furthermore $72.4 \%$ have enough friends and they trust strongly in their support in case of problems ( $78.2 \%$ ) (Table 23). However less than half children who agreed with given statement about sociability spend time with friends from school or other friend out of the school time. Almost all children that picked this answer agreed with statement referring to spending time without friends form school ( $29.26 \%$ of all respondents). Children generally more often spend time with friends virtually than not virtually however we must take into account that governmental ban on children presence in the public space until 16:00 (curfew) and without parents' custody might have distorted the results here (Table 24 and Teble 25).

## School life

It is very positive that most of the children like being in school (74.4\%) at least occasionally (20.8), sometimes (33.3) or often (20.3). In relations to their classmates half respondents value school success at the average level, but $44.4 \%$ feel they are performing good. Children generally feel safe there $-42.9 \%$ feel such often. Also feeling of belonging is high (63.9\%) (Table 26). Most are also satisfied with classroom judgment (60.2\%), peers acceptance ( $78.6 \%$ ) and their care ( $57.7 \%$ ). On the other hand when asked about relations with teachers some problems are visible. 41\% of respondents never or rarely feel ok if teachers are asking (be advised that such problems may also relate to self-confidence). Apart of these inconvenience children are perceiving teachers as accepting (53.1\% marked often, $25.7 \%$ marked sometimes value), and listening (23.1\%/34.6\%) (Table 27).

Violence, bullying and mocking are not so common. 56.1\% never experienced mocking, $77.4 \%$ never suffered violence, and $55.4 \%$ social ostracism. Nevertheless still more than one third of respondents experienced mocking and ostracism at least once and every tenth had been hurt or hit. Also $15 \%$ experienced verbal aggression at least three times in past year which might be considered as high (Table 28). Except of the gender factor also unfair treatment both by teachers and classmates were uncommon. This gender factor had been mentioned by respondents in case of classmates discrimination twice more often and in case of teachers five times often than factors like religion, economic status, nationality, place of living and language spoken. (Table 29) There is no problem with speaking in foreign languages in the school and many children recognize that even teachers are addressing to other pupils in other language (Table 30 and table 31).

Children who were responding to survey are generally open-minded. Prevalence and manifestation of one's identity and cultural heritage is important $72.5 \%$, more ( $75.6 \%$ ) cherish cultural diversity. School environment is perceived also as lacking cultural conflicts (67.9\%). Almost two thirds of respondents have friends from different cultures or religions (Table 33).

### 3.2 Newly arrived, long-term and local children

Micreate project distinguished three research groups of children in order to asses if there are any differences between their life adaptation practices and experiences of migration. These groups were divided into newly-arrived migrants defined as those who came to Poland not earlier than three years ago, long-term migrants that stayed in Poland for over three years and local children, that were born in Poland and always lived there.

If we look on migrant respondents in both of groups older children (14-20 y.o.) were dominant, however this was much more visible for those with shorter migration experience. Around two thirds of local children belonged also to older group. The gender proportion was balanced for migrants and again around two thirds of local children were girls.

Most of the migrant children in both groups comes from Ukraine however more than half of them are speaking Russian which is not a national language of the Ukraine. There is also relatively strong relation between the level of Polish proficiency and the length of the stay.

In reference to Polish citizenship around each four of long term and each tenth of newly arrived migrant children declared to have it.

As for the question related to the place of birth of their parents we believe that the question asked might have been ambiguous for many children that did not know if the point of reference was Poland or their country of origin. This is shown by the results in which $44.6 \%$ of new migrants and $31.6 \%$ of long term migrants have chosen "no" answer. If we take Poland as point of reference is contradictory to statistical knowledge available, but if the point of reference is Ukraine it might be closer to the truth as many Ukrainians were born in Russia or other former USSR republics. Furthermore this question was asked differently in Polish and differently in Ukrainian and Russian which was not noticed prior the analysis. For that reason we cannot draw any conclusions related to mixed families depending on these answers.

Dominant groups among long term migrants are either not affiliated with religion or do not wanted to answer this question, while new migrants slightly more often defined themselves as Christians than not affiliated. It might induce conclusion that migration to the country where it is harder to worship one's belief (lack of orthodox churches) may weaken religious affiliations. This is however only a supposition. On the other hand local children are again stronger attached to religion however much less than adult population.

All migrant group of respondents are predominantly live in Krakow. A significant larger group of local children ( $5 x$ ) live in the rural area - probably in villages surrounding Krakow, that might be somehow connected to higher socio-economic status of those children. Still, we need to admit that newly arrived migrants most often judged their economic status as higher to others.

It seems that migrant children have better perception of community diversity than local children. Two thirds of migrant group declared that they are living in ethnically diverse
communities while over one third of local children did not know that and another third denied. This difference cannot be explained by area factor but specifics of perception as Polish cities, including Krakow do not have districts with larger, not mentioning dominating clusters of foreigners (Pędziwiatr, Stonawski, Brzozowski, 2020:34-47). The result for local children could be affected by those who are living in rural areas that are for sure homogenous (15.2\%).

Map showing the immigrant population in Krakow - the intense of color represents the density of inhabitance.

Local children are likely to contest satisfaction from living in Poland (26.1\% vs. 6.4\% for migrants). The newly arrived are the most satisfied ( $80.4 \%$ ) while in course of living this satisfaction is slightly dropping (73.7\%) being still relatively high. Analyzing those result we need to consider the honeymoon effect influencing new migrants attitudes that is discussed in the literature (Hofstede, Pedersen, Hofstede, 2002: 23). The statistical dependence here is irrelevant. We did not retrieved the data allowing to compare newly arrived with longterm migrants for this particular phenomenon.

Looking into socio-economic status it must be noted that migrants perceive it better than local children which is surprising. The difference is not a big one but still twice as much new migrants consider their economic situation as good, comparing to local children and longterm migrants. This last group have the biggest trouble with covering the economic necessities. One fifth of those respondents declared poor economic status.

Slightly above half of new migrants are living with their families, comparing to 71\% of long-term migrants and $97 \%$ of local children. As we had written in previous Micreate
reports it might be explained by specifics of the migration schemes where large numbers of migrant children come to Poland to learn in high schools and are placed in dormitory homes. Long-term migrant on the other hands usually join the families who came before them.

The well-being in life was measures on fifth-grade scale. It had been measures for the satisfaction with life, control over life, self-acceptance and future perception. The mean in all questions were slightly above than average, with the most positive answers given by long-term migrants, who presented highest score for the future perception. Local children represented the lowest mean score in all categories, however here the inner diversity is much higher. Standard deviations were usually stably centered in plus and in minus. As there are no statistical tests made we cannot assess any real difference.

There are differences reported between migrant and local children reflecting the time spending habits. Although almost the same percentage of all groups are spending time using smartphones and computer, some difference is seen in real life social relations that are more common for migrant children, while local ones prefer to spend time alone or meet with friends online.

The social support perception from families and peers is very similar in results to those noted for the perception of well-being. The mean for long term children is highest while for local children lowest, with exception of number of friends and their support which is lowest for new migrants. It was not statistically tested however, but still this might be explained by the migration situation itself that transforms and deconstruct the previous social relations.

Some interesting results refer to the school life perception. The analysis here is based on numeric data so its assessment must be careful. All respondents generally like being in school, however long-term migrants less frequently to local and new migrants children. Local children three times as often as migrants never liked being in school. Migrant children slightly more often than local peers feel safe in the school. It is particularly visible for new migrants which might be explained by school functioning and organization that differs much in Poland and Ukraine in terms of safety (Pacewicz, Zacharuk 2016: 14). The feeling of belonging in the class is highest and most frequent in local children, followed by long-term migrants which is understandable by rules of adaptation process. There were interesting results referring to question of feeling good when being asked by teacher. Local children rarely or never feel good in such situation while migrants feel fine occasionally and sometimes, new migrants even often (highest percentage). We believe new migrants perceive asking by teachers as manifestation of interest. Most children feel also good with classmates' opinions on them and there are no significance differences between the children's group. Slightly more than average long-term migrants - one of tenth - declare not being accepted by peers, but in general over $80 \%$ of migrants and almost $80 \%$ of local children feel accepted by their peers. The same refers to teachers, however here the percentage of local children declaring acceptance by teachers is slightly lower. Children feel also that they are generally cared by their mates and their voices are heard by teachers, however here the frequency is lower than in the questions relating to acceptance. The
perception is though higher than observance of the manifestations of acceptance. New migrants more often notice teachers speaking about diversity.

There is no difference between children group in the frequency of mocking experience, but there is difference in the violence episodes which is generally not happening to new migrant but quite often experienced by long-term migrants. Ostracism is also seldom experienced by children and the rarest by new migrants. Here we need to take into account that lack of differences found might have been the effect of no relation or the small cohort.

As it was already noticed unfair and discriminatory treatment is not common both in relations with teachers and peers. However here, apart from discrimination caused by gender (highest felt by local children) around every four migrant experienced unfair treatment due to its nationality by teachers and two of five long term migrants felt that way in relation with classmates. The length of stay is moderately linked with the experience of unfair treatment from teachers caused by nationality but also by the language spoken. Here around quarter of migrants noticed such behavior, slightly less by long-term (probably due to language proficiency). Around $22 \%$ of new migrants and $26 \%$ of long-terms have such feelings in contacts with peers. These two categories put a clear demarcation line between migrants and local children experience.

The everyday language usage habits probably affected the answers referred to ability of use foreign languages in the schools space. A few more percent of long-term migrants (27\%) thinks they are not allowed to speak other language in school, comparing to new migrants ( $18.7 \%$ ). We believe that long-term migrants acquiring Polish communication competences more often feel obliged to use this language in social relations while new migrants are just forced to speak in their national language. New migrant also more often notice teachers speaking in other languages to pupils during lessons which could be explained by necessary communication schemes at the beginning of learning.

There is almost no numeric difference in perception of school achievement between migrant and local children. Surprisingly local children are more attached to the concept of diversity and integration with preserving customs and habits than migrant children while migrant children, especially new one higher prize the actual classroom diversity. Diversity is not seen as something conflict instigating. New migrants have more friends from different countries than local children however more than half of respondents in all groups have at least a few foreign friends.

Demographic data

## Ethnic background

There was no specific question about ethnicity in Polish survey but the dominant group of migrants were born in Ukraine - 82.6\% of newly arrived and 71\% of long-term children. The rest were represented by different nationalities - usually one person per country in each group.

## The languages you speak at home

Local children usually speak Polish, however single persons spoke Arabic, Portuguese and Italian. Some children were bilingual - one with Spanish and 22 (4.8\%) with English. Long-term migrant children are more linguistically diverse. They speak Russian (10), Ukrainian (8), and Polish or Polish with Ukrainian and Russian. Again single persons speak Turkish, Vietnamese, English or Armenian. The new migrants also speaks mostly Russian (34.8\%) and Ukrainian (29.3\%). If they are bilingual it is usually Russian and Ukrainian and Ukrainian and Polish. As there is almost no Russians in the cohort group it shows that there is some cultural oppression that impact Ukrainians in the relations with Russia.

### 3.3 Analyses according to demographic variables

In this section the attitudes of children/youth were analysed according to various demographic variables. This section will be the basis for the crosscutting analysis.

## Age - Well-being and everyday life

Analysis according to demographic variables starts with the age factor. Here if we reflect children perception of life satisfaction, control over it, self-acceptance and perception of the
future it is visible that children from younger group are moderately more positive in their views (Table 60)

In sociability dimension there are only few differences between younger and older group of children and both of them the most frequently spend time on smartphones and computers to maintain social contact (Table 64). Younger children however more often take part in organized leisure activities which might be explained by tradition of organizing such events for children in Polish primary schools. Older children, in turn spend more time alone (Table 61).

Younger children has also better perception of family support and caring as well as peers support and number of friends (no statistical importance) (Table 62). Younger children spend time mostly with their school mates while older ones with friends outside of the school. (Table 63).

## Age - School life

There is no significant difference in perception of the school between younger and older children. Older children slightly more often feel uncomfortable when teachers are asking them and has lower feeling of belonging to the class. The link between age and perception of belonging is statistically weak. There are also no differences in perception of teachers or peers attitudes between the age groups, however to some extent older children declare that teachers listen to them and take their position into account less often than in younger children declarations. Younger children observed also more frequent interest of teachers to talk about different countries and cultures.

Younger children more frequently experience mocking and violence. In the latter the difference is moderately significant. Also ostracism is higher in this group. This finding is
thus concurring with our state of art assessment referring to conflict matters discussed in children studies literature (Arun, Bailey, 2020:13). On the other hand discrimination and unfair treatment had been experienced a little bit more frequently by older children. It can be however explained by maturity of children that at older age can perceive more situations as discriminative. In general this perception is low in both groups.

The school achievement in comparison to peers is better seen by younger children who tend to score their achievements as good while older group tend to keep their judgement as average. Twice as much in the older group value their performance as bad. This is again a numeric assessment.

Older children price higher theoretical and practical dimension of diversity and integration autonomy, while on the other hand are more critical towards inter-ethnic peer relations. It is nonetheless to say that such relations are still perceived as good. Older children have more friends from other cultures and countries.

## Gender - Well-being and everyday life

While there was a possibility for children to select also the answer »other«, the numerus was too little to make any comparative analyses, therefore these answers were left out.

The results grouped according to gender does not provide any crucial results however in some categories there are some interesting facts to mention. It must be counted that girls
dominated in the study and for that reason some observation might be distorted by group unbalance.

The general satisfaction of life, control over it, self-satisfaction and perception of future was higher among boys.

In the context of sociability girls more often spend times on smartphones or alone (by numbers). Difference is small however. On the other hand when asked about sociability patterns girls tend to be little more sociable spending times both with friends from school and out of school.

Boys better perceive family and peers presence and family support. Girls here may more often count on their friends if experience problems.

## Gender - School life

There are no differences in school rating, but girls feel safer there than boys, while boys have stronger feeling of belonging. Boys are also more confident when asked by teachers, and slightly more often are satisfied with peers' opinion on them. This is contradicted with similar question about classmates' acceptance where more girls were confident on acceptance. Boys feel rarely accepted by teachers with overall high score in this value. Boys do not feel as much cared about their feeling however such result is expected considering difference in social relations, its proximity and social warmth between boys and girls. Boys more often notice teacher's engagement to talk about different countries, languages, cultures and religions. All that data must be interpreted with caution as domination of girls in the cohort might have affected those conclusions.

Unpleasant experiences, including violence is low, but boys more often suffered mocking, physical violence and ostracism (more frequently indicated the recurrence of such incidents).

The perception of unfair treatment and discrimination is surprisingly at almost the same level for both genders. Girls have such feeling slightly more often towards classmates. Boys declared slightly more often to be treated unfair by teachers due to their nationality. This correlation is strong. Twice as much them claimed that children are not allowed to speak other languages in school.

Girls perceive better school performance while boys rate it as average. Differences her are small however and insignificant.

Girls have higher perception of theoretical and practical dimension of diversity and integration understood as the right to preserve and express one's culture. Boys and girls have rather equal number of friends from different countries.

|  | $\%$ | $10.5 \%$ | $53.4 \%$ | $22.4 \%$ | $13.7 \%$ | $100 \%$ |

## Ethnicity - Well-being and everyday life

It is not possible to make survey analysis accroding to ethnicity variable as the group was ethnically homogenous, represented in $96.5 \%$ by Slavic persons. Those who were not Polish were Ukrainians. All other except two people were Europeans. We had one Latino person and one Asian. Two people declared Romani origin. The group is too small to draw any conclusions.

## Ethnicity - School life

Not possible to make survey analysis according this variable due to homogenity of the group.

## Citizenship - Well-being and everyday life

The survey cohort had been ethnically and nationally homogenous grouping mainly Polish and Ukrainians, with a few and singular persons representing other nationalities, so the only possible variable to distinguish was that relating to citizenship status.

Surprisingly, analysis of numeric data showed that respondents without citizenship have better perception of life satisfaction, control over it, self-satisfaction and future perspectives. These respondents are also more sociable meeting and playing with friends almost every day, while large number of Polish people (41\%) spending time alone.

Non-Polish might have better perception of family support, while Polish are more convinced to have enough friends and receiving support from them. Polish respondents however indicated more virtual contacts with their friends. None of these conclusions is firm.

## Citizenship - School life

Perception of school is also slightly better for respondents without citizenship, as the feeling of safety does. Nothing significant however so differences cannot be distinguished. On the other hand Polish have greater perception of belonging which is nothing surprising. Foreigners better respond on asking by teachers and higher perceive the classmates opinion about them. They have also stronger feeling of acceptance and being heard by teachers and being cared by peers, and less oppressed. They rarely experienced mocking, violence and ostracism, and at this last category there is a weak statistical difference. Again we need to indicate here that all those relations might be affected by the cohort sizes.

At the fair treatment and discrimination dimension we observed a moderate statistical differences related to nationality and language spoken if asked about the relations with teachers and classmates. Over one of four foreigners felt such discrimination based on origin
and language spoken. To some extent foreigners reported less accounts of discrimination based on gender. They are however more reserved in perception of possibility to speak other languages in school and noticed less occasions where teacher used other languages for communication in the class.

Foreigners see themselves are more successful students, like class diversity more but have a little bit weaker perception of allowance to express one's cultural habits and customs. They have also more foreign friends. The size of respondents' groups may have some impact.

## Religion - Well-being and everyday life

The religion variable was divided into three groups - Catholics, other beliefs and not affiliated. In the following paragraph we will be using names Catholics, non-Catholics and no believers to mark those certain groups.

In the question related to perception of life believers, especially Catholics presented greater satisfaction with life, control over it, self-satisfaction and perspectives for the future.

In sociability dimension all preferred to use smartphones and computer while contacting with friends, however those not affiliated formed larger group that did it slightly more often (no statistical tests). The non-Catholics more often spend time by meeting friends however if we cross-examine this relation we believe it is more related to migration status variable where we observed similar effect.

Those not affiliated with religion has less confidence in family support, while nonCatholics fell more often that they lack friends and cannot count on them. Non-believers rarely spend time with friends from school and prefer virtual contacts, while non-Catholics are preferring real life contacts. Her again this relation probably is better explained by migration status.

## Religion - School life

Catholic children tend to more like school, while non-believers most frequently choose answer of ever dissatisfaction with school presence (19\%). Not affiliated student felt also less safe at school, had discomfort when asked by teachers and were less confident about the opinions of their classmates. This differences were statistically significant however relationship was weak. Non-Catholics felt more accepted and understood by teachers and less cared by their classmates. Relation with classmates referring to care was relatively strong.

Non-believers has been less frequently victimized by mocking and violence, however experienced slightly more often ostracism, that was lowest at the non-Catholic group.

The feeling of unfair treatment and discrimination by either teachers or classmates showed that non-believers felt more discriminated by teachers with difference almost reaching the level of statistical importance (no difference found), while non-Catholics felt treated unfairly by both communities with moderate effect size. The same result could be observed with the place of living variable and language spoken. Again, as faith other than Catholicism was connected to being Ukrainian we believe that nationality is the right differentiating factor as data acquired here is similar to those acquired there.

Children who are not affiliated with religion tend to place themselves as average students more often than those who are religious (no test provided).

Children not affiliated with religion have higher faith in diversity and right to express it, as well as accept such diversity in the classroom. Catholics on the other hand to greater extent believe in peaceful coexistence between diverse students.

Non-Catholics have more foreign friends which again we believe is connected to origin and not belief.

## Socio-economic status - Well-being and everyday life

The socioeconomic status was divided into three groups - children whose families do not have problems with covering necessities (well-endowed), those who have some difficulties (average-endowed) and those who have difficulties with covering economic necessities (less-endowed). The group with average income was dominant, while the two other groups were equal by respondents.

The measurement of life satisfaction is strongest for those well-endowed but with highest deviation from the mean ( $3.76-\mathrm{dev} .1 .204$ ). Those children have high control over the life, but have slightly lower self-esteem and perception of the future from those average-endowed. Those with a lot of economic difficulties scored lowest in all dimensions. This results are not surprising as economic stability is important factor measuring life satisfaction.

Those who experience a lot of difficulties with some significance rarely engage in social life, especially meeting friends and even using smartphones or computers for such contact.

They more often spend time by themselves. Here the difference is the strongest, but still statistically weak.

Those less-endowed stick out also in dimensions of family and peers support as well as feeling of being enough befriended. In the last category there is positive deviation however indicating some positive answers differing from mean. If they spend time with friends they are not from their school. Unfortunately half of this group do not spend time with their schoolmates.

Table 118 - Socio-economic status

|  | F | \% |
| :--- | :---: | :---: |
| In our family, we do not have difficulties to cover our economic necessities | 62 | $10.5 \%$ |
| In our family, we have some difficulties to cover our economic necessities | 464 | $78.9 \%$ |
| In our family, we have difficulties to cover our economic necessities | 62 | $10.5 \%$ |

Socio-economic status - School life

To a greater extent children with a lot of economic difficulties dislike being in school, has lower perception of safety, stronger feeling of alienation, do not like being asked by teachers (moderate significance), and low perception of class acceptance, classmates acceptance and teachers acceptance. Class acceptance is significantly stronger perceived by well-endowed children. The children with a lot economic difficulties rarely or never feel cared by their peers and listened and understood by teachers.

Such children experience also more mocking, violence (difference statistically significant), and social ostracism.

Those well-endowed feel significantly more unfairly treated by gender and together with those having a lot of difficulties feel treated unfairly due to religion by their teachers in comparison with those who are average. There are also slight differences in perception of unfair treatment referring to nationality, place of living and language spoken but relations are weak.

Those less-endowed slightly less frequently rate their school achievement as good. Those who are average economically have stronger believe in diversity, right to express it and thing that diverse children get along well.

## 4. Conclusions and discussion

The quantitative research had been made as an online survey study that become necessity due to the national epidemic emergency and restriction imposed on personal contact and enforced social distancing related SARS-CoV-2 pandemic outbreak. There was no possibility to enter schools or contact with children directly and the survey was made and managed by cooperating teachers. This made impossible for researchers to supervise the survey performance process and explain possible ambiguities to children. We believe that it affected the study at least in one question that related to the place of birth of parents that had different wording in Polish and Ukrainian/Russian versions of survey and may caused ambiguity in replying, distorting the acquired results.

Nevertleless we observed that the overall population was rather homeogenous and binational. Our cohort was represented by Polish and Ukrainians, dominantly Christians or those not affiliated with any religion. Almost two thirds of study population were girls. The population of younger children was bigger however divided by project's target group the older group occurred to be larger.

One of the most interesting finding was the frequency of speaking Russian at home of the migrant childen showing that large group of Ukrianians prefer to use this language in every day communication rather than Ukrainian. In general there is a link between length of stay and proficiency in Polish.

Local children was the largest group in study population (78\%), followed by new migrants ( $15.5 \%$ ) and long term migrants ( $6.5 \%$ ). If we look at the gender proportions in those groups it happen that among migrant children the gender was balanced while for Polish children girls dominated study.

When comparing to adult population in Poland it occurred that children in all groups are less affiliated with religions and often do not want to declare any affilations. This was confirmed further on in the interviews with children, especially those long-term.

Most of the children do not see much differences between them and other peers also in the economic dimension. Most of them are optimistic, satisfied with their lives, declaring control over it, good level of self-satisfaction and feel positive about the future. Here however children that declared having a lot of difficulties in covering economic necessities falls out this framework being much more pesymistic. These children are also less sociable and their opinions referring to functioning in school and out of school reveals greater social distancing, alienation and lowered self-confidence. Worse social functioning of such children was the only visible factor that could in so many variables differentite children who took part in the study. Unfortunately results showed that those less-endowed children more often belong to the group of long-term migrants which might led to conclusion that perception of success of long-term migration fails. For sure it must be treated as a warning light and base for further research on biographies of long-term migrants and eventual constraints in integration and personal success. On the other hand a big number of lon-term migrant children have optimistic perception of the future which also prompts for further elaboration.

The data collected in the survey is much consistent, one variable is confirmed by another building a coherent picture of a migrant child that is Ukrainian, Orthodox or not-affiliated, satisfied with current life, self-confident, rather sociable and liking to be in school. Migrant children more often than their local peers have real life social relations.

School is seen as friendly and safe place however local children do not feel there as well as migrant children do. We assume that significant better perception of Polish school by migrants is connected to the difference in those institutions in Poland and Ukraine. In the country of origin school are still much authoritarian. In the interviews conducted with migrant children it was underlined that Polish school appeared to them as sanctuary when comparing to Ukrainian model. Functioning in certain regimes in their county of origin caused migrant children to be more engaged, active on classes and conscientious in fullfiling tasks and obligations. It was confirmed well in the observation phase of the study.

Children do not experience negative incidents in the school. Mocking, bullying, violence and ostracism are rare. The perception of unfair treatment by peers or teachers is also low. The only deviation from this trend relates to gender discrimination which is seen as highest. Surprisingly both genders perceive such discrimination at the same level. There is a relatively small group of migrants who felt discrimination related to their nationality and language spoken.

The survey study did not reveal any profound or exploratory findings. It occurred that local and migrant children have much in common. Children are integrating well, however economical starus is much affecting the sociablity and life satisfaction of children in all dimensions. The perception of success in long-term migrants needs further evaluation.

## 1. Introduction

This document contains all the data and analyses of the results coming from the survey implemented in ten Spanish schools during work packages 5, 6, and 7 of the MiCREATE project. It starts with a description of the methodology used in the implementation and clean up of the data, to then present the sample data, first as a whole, and then divided across different variables (time since migration, age, gender, ethnicity, citizenship, religion, and socio-economic status), along with the analysis of the researchers. To end, the conclusions of the analysis of the Spanish case are presented.

## 2. Methodology

The survey was conducted in the 6 schools where WP5-7 field work was carried out, plus 4 other schools, all of them from Catalonia. The last 4 schools were added to the sample in order to reach the 500 answers required by the project. The questions were translated from English to Spanish and Catalan, the official languages of Catalonia, and students could choose in which language they wanted to answer the questionnaire. The data collection period lasted from October 2020 to January 2021. The criterium to identify participants was different depending on the school. For the 6 core schools, the criterium was to pass the survey to pupils involved in focus groups and interviews. For the 4 extra schools, the criterium was to accomplish the age range required for the project and in two of them also those groups in which teachers had availability to administer the survey.

Regarding the procedure for obtaining families/guardians consent, after all schools' managerial teams reviewed the survey, most of them considered that the consents were not necessary. Once S2, S7, S8, S9 and S10 ascertained that questionnaires were anonymous and voluntary, they did not see problems for students to respond and, therefore, there was no need to create a specific document of consent for the survey. S4 acted as a representative since all the parents and legal representatives signed an agreement of participation in extracurricular and research activities at the beginning of the school year. This was also the case for S3, S5 and S6, where informed consents signed by parents would have been difficult to obtain. In all cases, the parents and legal representatives of all schools were informed of the project specifically from its beginning. The S1 management team followed the same procedure but, after administering the questionnaires to the pupils, received complaints from some migrant families whose students did not understand some of the questions in the survey.

In the end, a total of 604 questionnaires were filled in. However, only those that were at least $75 \%$ completed ( 6 questionnaires) plus those that were $100 \%$ completed (555) have been taken into account for the analysis. Therefore, this analysis includes responses from 561 questionnaires: 78 in S1 (face to face); 35 in S2 (CAWI); 99 in S3 (face to face); 3 in S4 (CAWI); 33 in S5 (face to face); 10 in S6 (face to face); 94 in S7 (face to face); 44 in S8 (CAWI); 72 in S9 (CAWI); and 93 in S10 (face to face). Eleven researchers were involved. In the schools where the survey was answered online, researchers did not participate in the process. The link to the survey was sent to each school's principal and they sent them to the teachers in charge of managing the student survey. In schools where questionnaires were completed face-to-face, researchers accompanied and guided students through the survey. They introduced the task to the students, explained it in detail and answered students' questions on those parts of the survey that they had difficulties in understanding or knowing how to answer. In addition, the questionnaires were completed on paper, except in S 6 , where pupils answered the survey using their mobile phones, as they were allowed to use them in the classroom on an ad hoc basis.

In S1, 3 researchers were involved; in S3, 3 researchers; in S5 two predoctoral researchers were involved; in S 6 one predoctoral researcher was involved; and in S10, 3 researchers took
part in the process.In all schools, staff were involved in a variety of ways. In S2, S4, S7, S8 and S9, teachers implemented the survey. They explained the aim of the activity to the students and worked in the way they thought best. In S1 and S5, teachers were involved from the very beginning. In some cases, teachers worked hand to hand with those students who didn't have a good grasp of the language, explaining the questions, giving examples, translating some words, etc. In addition, teachers from S5 discussed with students the work done with the survey, reflecting with them on the importance of the questions asked. In S3, the staff introduced the researchers. In S6, teachers provided the participants with basic information about the research before researchers' intervention. Finally, in S10 the staff organised the space, facilitated contact with students and helped when it was needed.

Regarding the involvement of researchers, in S2, S4, S7, S8 and S9, they provided the necessary information for the teachers to be able to administer the survey without their presence. In those schools in which researchers implemented the survey in paper and face to face, before young pupils started to fill the survey, they introduced it with a brief explanation informing them about anonymity and privacy, explained them that it was part of the MiCREATE project and that it was a questionnaire that collected data from schools throughout Europe. In S1, S3, S5, S6 and S10, researchers introduced the survey and helped students during the process of answering the questionnaire (solving doubts, working individually with those students who did not understand the questions, etc). At the end, researchers uploaded the answers to the online platform, except for S6, where participants used their mobile phones autonomously. In addition, in S3 and S6, the questionnaire was passed after the focus groups and most interviews had been conducted, so it was not necessary to remind participants of the context of the project.

Since researchers had tested the survey with the Child Advisory Board (CAB) before implementing it, they were aware that some questions were not going to be easy to understand by some students, especially those between 10 and 13 years old. For this reason, when teacher involvement was possible it was really useful. From our point of view, it is important to make sure that the words used in the survey are already included in the students' vocabulary, or at least are terms they already know and use at their age. Furthermore, students felt unsure and hesitant with sensitive questions. When it occurred, researchers and teachers reminded them that they were free to answer them or not, so, if they felt uncomfortable it was not necessary to answer all the questions. That's why from 604, only 561 were complete enough to be taken into account for the analysis. In schools S1 and S 3 some students did not want to participate.

Another difficulty was that not all students from the same class had the same level of Spanish and/or Catalan. That entailed that some students needed much more time to complete the questionnaire than their classmates. Also, it was very difficult to achieve that newly arrived students, who mostly did not speak Spanish or Catalan, completed the questionnaires. This was also detected in the test made with the CAB, although the differences in language level were not as pronounced as in some of the participating schools.

In S4 and S8, the survey could not be properly contextualised and presented by researchers due to the COVID restrictions in place. Moreover, in S4 participation in the survey was very low since it was presented as a voluntary activity to be filled out of school time. Finally, there were no problems or difficulties reported by teachers in the schools in which the survey was implemented by teachers.

## 3. Results

### 3.1 Sample population

## Demographic data

The sample is based on $84.5 \%$ students between 9 and 13 years old and $15.5 \%$ between 14 and 17 years old (Table 2). The Spanish educational system differentiates primary from secondary school at the age of 12 . In this sense, looking at it from the point of view of the Spanish education system, the participants from primary school and secondary school would be more balanced ( $50.5 \%$ from primary school and $49.5 \%$ from secondary school). Also, the sample is balanced in terms of gender: $46.7 \%$ female; $51.9 \%$ male; $1.4 \%$ other (or no binary). This last group of respondents was not taken into account for the analysis, as they represent a very low percentage.

Regarding how long they are living in Spain, 21\% were born out of Spain (Table 9). From those, $8.8 \%$ are newly arrived students and $12.6 \%$ are long-term (Table 11). The most common regions they come from are: 1) European countries (10.1\%1); 2) Latin American countries ( $9.5 \% 2$ ); 3) Arabic countries ( $4.6 \% 3$ ) (Table 10). However, of the $78.6 \%$ of local students (Table 11), 44.4\% of their parents were born in Spain (Table 16). This means that at least $33.5 \%$ of local students have families of immigrant origin.

The question about their culture of origin was difficult for the students to understand and answer. Therefore, the gathered data does not always specifically refer to their culture of origin, but sometimes it gives information about where they live now, where they come from or where their parents come from. Once this is clarified, one interesting point is that from $21.4 \%$ of students not born in Spain ( $8.8 \%$ of newly arrived students, plus $12.6 \%$ of longterm students, Table 11), 13\% felt they belonged to more than one culture (Table 6).

At the same time, almost 9\% speak more than one language at home, and for all of them one of these languages is Spanish (Table 74). The parents of $45 \%$ (Table 16) of the 78.6\%

[^94]of local students (Table 11) were born in Spain, which means that there are 34.2\% of local students with immigrant parents.

Another peculiarity is that almost half of the migrant students ( $9.5 \%$ of the $21 \%$ of all migrant students) come from Latin American countries (Table 10) whose official language is Spanish. This might partly explain why looking at Table 8, only $4.1 \%$ of newly arrived and long-term students do not speak Spanish very well5. In addition, since the participants live in Catalonia, $11.95 \%$ of students also speak Catalan at home (Table 76), although it is less widely spoken than Spanish (Table 8).

Looking at the students who do not have Spanish citizenship (8.6\%), we can infer that these data belongs to newly arrived students (8.8\%). However, it is also remarkable that $14.1 \%$ of participants did not know if they have Spanish citizenship or not (Table 13).

When asked by their religion (Table 17), the answers show three main groups: Christianity (27.4\%), Islam (20.1\%), and those who are not affiliated to any religion (31.9\%). This can be explained because: 1) Spain's main religion is Christianity, although schools of the sample, all of them public, are considered secular; 2) the most practised religion in Latin American countries is also Christianity. In addition, $14.4 \%$ of participants did not know if they feel affiliated with a religion.

Regarding how they perceive living in Spain (Table 21), although 83.8\% of participants like living in Spain, when they were asked in which country they would like to live (Table 22), the answers were very diverse. However, the most answered country was the United States (16.17\%), followed by European countries such as France (9.8\%), Italy (3.8\%) and the United Kingdom (2.7\%), and Japan (7.3\%). An interesting fact is the high percentage of participants that answered Andorra ( $4.81 \%$ ), since it is a very small country that is not very well known and does not belong to the European Union but maintains a close relationship with Catalonia. The reason could be the recent news concerning youtubers and other Spanish public figures moving to Andorra to evade taxes7.

Another interesting fact is that around 10-20\%8 like living in Spain despite having some difficulties (31\%) or difficulties to cover their economic necessities (3\%) (Table 23).

## Well-being and everyday life

More than half of the respondents are satisfied with their lives9, like the way they are10 and feel positive about their future11. This can be due to the fact that more than $80 \%$

[^96]consider family as a good support and helper12, and a similar percentage 13 feel the same towards their friends (Table 27). These friends are not only from school, since 41.4\% of participants spend time outside school with other friends (from the neighbourhood, etc.) (Table 28). Although, with these numbers, we might suppose that they have a very social life, they spend more time connected online with friends outside school than meeting face to face14. And $34 \%$ of respondents rarely or never participate in organized leisure activities.

In addition, almost half of the sample spends time being by themselves every day or almost every day (48.3\%, Table 26).

## School life

Very few students do not feel good at school and do not feel they belong to their classroom (around less than 7\%, Table 30). We could infer that these are the same that have been felt treated unfairly because of their gender ( $10.3 \%$ ), nationality ( $7.5 \%$ ), or religion (6.6\%). What is more worrying is that around $5 \%$ of respondents have felt disadvantaged by teachers because of their gender ( $4.8 \%$ ), the place where they live ( $4.6 \%$ ), or the language they speak ( $5.7 \%$ ) (Table 33). Therefore, it seems that although a great number of students feel listened to and supported by teachers, schools do not fully embody a multicultural approach. In addition, only 11.9\% of participants consider that teachers often talk about different countries, languages, cultures, or religion in class, and $42.8 \%$ feel that they do sometimes (Table 35). Thus, schools have achieved a multicultural community of
students in which very few feel excluded, and where all of them cohabit school with many friends from different cultures (42.6\%, Table 38).

### 3.2 Newly arrived, long-term, and local children

## Demographic data

The total number of newly arrived students that answered the questionnaire was 49, the $8.8 \%$ of the sample of 561 students (Table 11). Newly arrived students mainly come from Latin American countries (52.1\%) and Asian countries (21.7\%) (Table 50). The countries from Latin America they migrated from were Venezuela (19.6\%), Dominican Republic (8.7\%), Colombia (4.3\%), Argentina (4.3\%), Honduras (4.3\%), Perú (4.3\%), Bolivia (2.2\%), Chile (2.2\%), and Cuba (2.2\%). The Asian countries were Pakistan (15.2\%) and Russia (6.5\%).

Regarding long-term students, a total of 70 answered the questionnaire, $12.6 \%$ from the sample of 561 students. Long-term students mainly come from Latin American countries (45.8\%), and Asia (26.2\%) (Table 51). The Latin American countries include Honduras (13.1\%), Ecuador (6.6\%), Dominican Republic (4.9\%), Peru (4.9\%), Argentina (3.3\%), Chile (3.3\%), Colombia (3.3\%), Cuba (1.6\%), Nicaragua (1.6\%), Salvador (1.6\%), and Uruguay (1.6\%). The Asian countries were Pakistan (13.1\%), Bangladesh (9.8\%) and China (3.3\%).

Besides countries from these main regions, the countries where more students come from are Romania (6.6\%) and Morocco (4.3\%).

Comparing Tables 50 and 51 with Tables 41, 42 and 43, looking at the cases of newly arrived and long-term students, there is mainly a correlation between countries that students were born and their culture of origin. Only in some cases students consider Spain also as a culture of origin, beside the country they were born in. These are the cases of a few newly arrived students coming from Venezuela ( $2.1 \%$ feel Venezuelan and Spanish) or Bangladesh ( $2.1 \%$ feel Bengali and Spanish). And a small number of long-term students coming from Chile ( $1.4 \%$ feel Chilean and Spanish) and Bangladesh as well ( $1.4 \% \mathrm{feel}$ Bengali and Spanish). There are also interesting cases in which students express multiple cultures of origin, different from Spanish and the country they were born. For example, 1.4\% of newly arrived students consider themselves Venezuelan and Argentinian. Regarding longterm students, 1.4\% feel Argentinian and Peruvian, 1.4\% Argentinian and Uruguayan, 1.4\% English and South African, 1.4\% French and Algerian, 1.4\% French and Colombian, 1.4\% French and Honduran, and 1.4\% Italian and Nigerian.

Regarding local students (Table 43), almost half of them (46\%) ${ }^{15}$ do not feel Spanish or they feel Spanish plus another culture of origin (12\%) ${ }^{16}$. In addition, according to Table 53, the parents of $50.6 \%$ of local students were born in a country other than Spain. Again, we can infer how culturally diverse the group of local students is. Another curiosity in local students is that some of them responded with multiple cultures of origin but all of them belong to different regions of Spain.

In terms of citizenship, 38.8\% of newly arrived students answered they did not have Spanish citizenship, $36.7 \%$ did not know and only $20.4 \%$ were sure they had it. Looking at long-term students, 20\% answered that they did not have Spanish citizenship, 32.9\% did not know and 40\% were sure they had it (Table 52).

When asked about their affiliation with a religion (Table 54), there is a predominance of two religions: Christianity (with 37.5\% of newly arrived students, 34.3\% of long-term students and $25.4 \%$ of local students); and Islam (with $31.3 \%$ of newly arrived students, $27.1 \%$ of long-term students and $17.6 \%$ of local students). Only $2.6 \%$ of local students answered that they were affiliated to 'other' religions. It is also remarkable the higher percentage of local students not affiliated with any religion (36.9\%) compared to newly arrived students ( $16.7 \%$ ) and long-term students (14.3\%).

Looking at the tables related to language, the most common fact among newly arrived students, when not coming from Latin American countries, is that at home these students speak the language of origin of their parents (Table 44), while among long-term students there are more cases where students speak the language of origin of their parents plus Spanish (Table 45). However, it is remarkable that $14.7 \%$ of newly arrived students speak Catalan with their parents since Catalan is only spoken natively in three Spanish regions and Andorra (Table 44).

Another relevant data is that many newly arrived students (51\%) and long-term students (68.6\%) speak Catalan well (and 7.1\% of long-term students consider themselves to speak Catalan very well) (Table 47).

[^98]Regarding the local students, Table 46 shows how culturally diverse this category is, since some of them ( $8.8 \%$ ) speak at home only another language that is not Spanish or Catalan ${ }^{17}$, or combine Spanish/Catalan with some other language (13.7\%) ${ }^{18}$.

In regard to socio-economic status, there is no difference among categories.

## Well-being and everyday life

In general, there are no differences between categories when students are asked how they feel in life. Most of them are satisfied with their lives. Where there are differences is in how these students spend their leisure time. Local and long-term students do more organized activities than newly arrived students (Table 61). And local students meet with friends online more often than newly arrived and long-term students (Table 64). However, there are no differences between them regarding time spent with friends and how technologies are part of their leisure time.

## School life

It is worth noting that Table 65 shows certain disaffection to school depending on the category. Newly arrived students like being at school more often (56.3\%) than long-term ( $37.7 \%$ ) and, at the same time, long-term students like being at school more often than local students (29\%). In addition, looking at Table 66, newly arrived students are the group of students more satisfied with their relationship with teachers.

The major difference is when students are asked if they have been hit or hurt (Table 67). In front of $8.6 \%$ of long-term and $9.2 \%$ of local students, only $2.2 \%$ of newly arrived have suffered this more than three times. The reasons for unfair treatment are also more similar between long-term and local students than newly arrived students (around two or three times more) (Table 68). Long-term students are the groups that feel more harassed by their classmates, especially for reasons of gender (15.4\%), religion (9.4\%), nationality/race ( $15.8 \%$ ) and the language they speak ( $9.5 \%$ ). Local students, although the percentage is lower, also feel harassed by their classmates in terms of gender (10\%), religion (6.6\%), nationality/race (6.4\%) and the language they speak (6.7\%).

It is also remarkable the percentage of long-term students that felt treated unfairly by teachers in aspects of gender (6.3\%), where they live (6.5\%), and especially the language they speak (9.2\%).

### 3.3 Analyses according to demographic variables

In this section the attitudes of children/youth were analysed according to various demographic variables. This section will be the basis for the crosscutting analysis.

## Age - Well-being and everyday life

Students between 9-13 years old feel slightly more satisfied with general life than students between 14-17 (Table 74). Although there are no significant differences in how they spend their leisure time, older students use more digital technologies for meeting with
friends than students between 9-13 years old (Table 75). The main difference is that 74.4\% of 14-17 students spend time just being by themselves in front of 43.4\% of 9-13 students (Table 75). Regarding confidence in parents and friends, younger students feel more supported by their family than older students (Table 76).

In terms of socialization, students aged between 14-17 have a more active social life outside of school than students aged between 9-13. They spend more time out of school with friends other than those at school than younger students. In addition, $34.4 \%$ of this last group do not spend time with friends out of school in front of $24.1 \%$ of older students (Table 77). Looking at Table 78, young people spend more time with their friends than students, regardless of whether it is face-to-face or online.

Figure 78.1

## Age - School life

Younger students feel more engaged with school than the older ones (Table 79). At the same time, students aged 14-17 years show a greater disparity of responses on the Likert scale than students aged 9-13 years, who mainly answered the questions with "often" or "sometimes".

Although the younger group is more satisfied with their relationships with peers and teachers than the 13-17 years old (Table 80), they are also more often harassed by their classmates than the older ones (Table 81). However, when looking at the reasons why students have suffered unfair treatment (Table 82), the percentage of the older age group is higher than that of the younger ones. The main reasons are gender (13.8\%), nationality ( $11.1 \%$ ), religion ( $9.6 \%$ ), and the language they speak ( $8.3 \%$ ). In the case of students between 9-13 years old, the main reasons are gender (9.7\%) and nationality/race (6.8\%). It is also noteworthy that $13.3 \%$ of students between 13 and 17 years of age have felt treated unfairly by their teachers in terms of gender, and $7.3 \%$ in terms of the language they speak. In relation to students' perception of their school performance (Table 85), almost twice the
percentage of younger students perceive their performance to be very good (42\%) compared to the perception of older students (19.8\%).

## Gender - Well-being and everyday life

Boys feel slightly more satisfied with general life than girls (Table 88). Although their social life is very similar and active, boys spend more time doing organized leisure activities and meeting and playing with friends than girls. However, girls use digital technologies more often to be in touch with their friends than boys (Table 89).

There is also a deviation in the perception of having enough friends. Although both groups feel supported and listened to by their friends and family, more girls than boys feel that they do not have enough friends (Table 90).

Regarding how they spend their leisure time, girls tend to not spend much time with friends in comparison with boys (Table 91). And when they do, they do it more often on the Internet than boys (Table 92).

## Gender - School life

In terms of how they feel at school, generally boys feel better than girls (Table 93 and 94). They feel slightly more attended, cared, accepted and safe at school than girls. The only thing girls feel better about than boys is the feeling that they are accepted by teachers in the same way as their peers (Table 94). This is more remarkable in Table 95 and 96 related to harassment suffered and unfair treatment. Girls usually suffer more verbal abuse or mocking whilst boys suffer more physical aggressions (Table 95). In addition, girls have suffered more times unfair treatment from their classmates than boys, especially for gender reasons (17.6\%). Less remarkable but also worth mentioning is that girls also suffer more unfair treatment due to their religion ( $7.5 \%$ of girls compared to $5.9 \%$ of boys), and the dimension by which more boys are treated more unfairly than girls is nationality/race.

When asked by their performance (Table 99), both answer similarly. But when they are asked for inclusion at school, girls are slightly more inclusive than boys.

## Ethnicity - Well-being and everyday life

As stated earlier, the Spanish survey didn't directly ask for ethnicity, because that is a word that is very rarely used in Spain, and we thought the students wouldn't understand it. Instead, the question referred to their "culture of origin", with an open text field to insert the answer. This left us with a variety of answers that can be traced to ethnicity, but that are not easily understood as ethnicity. Most answers are related to the place where they or their parents were born or their religion. There's also a good number of answers that include
multiple "cultures of origin", as detailed in Table 6. This lead us to divide the responses in three different groups: "European" (50.9\%), "Latin American" (13.1\%), and "Other" (36\%), that includes those that are from Africa and Asia, those that answered with a religion, and those that included multiple cultures that can't be included in the other groups. A more detailed analysis, with more groups, was deemed unfeasible as the number of cases is too small to achieve statistical significance.

When asked about their life (Table 103), the three groups answered in a similar way except for the question related to life satisfaction. Students from Latin American countries are the ones more satisfied with their lives. This can be connected with the fact that it is also the group who feel more supported by their families (Table 105). In contrast, although the European group is the one who feels less satisfied with life (Table 103), it is the group that feel more supported by friends (Table 105). This idea is reinforced by the results in Table 106, where European students spend the highest percentage of leisure time with school friends and a very high percentage of time with other friends. In terms of how these groups spend their time, they all agree that they spend it more often online than in person (Table 107). Moreover, students from Latin American countries spend more time meeting and playing with friends than the other groups (Table 104)19. However, students from European countries use more digital technologies to stay in touch with friends/relatives than the other two groups20.

## Ethnicity - School life

The students surveyed have, in general, a positive perception of their life at school. Most Latin American, European, and Other students like being in school, they feel safe, feel they are part of their class, and feel comfortable interacting with their teachers. Also, they feel that their classmates have an acceptable opinion of them (Table 108). However, in all groups there is a small but no less important percentage of respondents who indicate that they do not have a positive experience with school life.

When analysing the relationship with classmates in more detail (table 109), for most students this relationship is positive, as they feel accepted by teachers, by their classmates and they feel listened to by their teachers. The positive perception is lower in the question "My classmates care about how I feel" and it is also less frequent, from the students' point of view, in the question "My teachers talk about different countries, languages, cultures or religion".

In regard to instances of harassment during the last school year (Table 110), the majority responded that they had never experienced a bullying situation in the last year. However, there is a considerable percentage of students who have experienced some form of reiterative violence. According to responses, the most frequent instances of harassment is verbal violence. However, in smaller percentages, physical violence such as beatings and micropolitical violence as exclusions from games or activities are also observed.

## Citizenship - Well-being and everyday life

According to Table 117, there is not much difference between students with Spanish citizenship and students without Spanish citizenship. Both groups are quite happy with their lives. Only one relevant data is that precisely students without Spanish citizenship feel considerably more positive about their future than students with citizenship.

Looking at Tables 118, 120, and 121 students with citizenship have more social life than students without citizenship. They are involved more often in leisure activities and spend more time with friends. In addition, the first group of students feel more supported by family and, especially, by their friends than the second group (Table 119). This could be because of those who have the nationality are more 'settled', so they have a stronger and more stable affective network than those who do not have the nationality.

## Citizenship-School life

Students without citizenship like being in school more than students with citizenship, although they do not feel as included as students with citizenship, and they appreciate it more when being asked by teachers (Table 122). In addition, students without citizenship feel more often listened to and attended by their teachers than students with citizenship (Table 123). This could be due to two facts: 1) schools feel engaged with migrant children integration and, therefore, pay special attention to these children feeling well at school; 2) people with a more uncertain personal life are more appreciative of any attention.

Regarding situations of bullying, students with citizenship suffer more from this kind of situation than students without citizenship (Table 124). However, students without citizenship suffer more because of their religion ( $9.1 \%$ ), nationality ( $12.5 \%$ ), the district where they live ( $7 \%$ ) and more remarkable, the language they speak (14\%). It is also remarkable that $6.7 \%$ of students without
citizenship felt harassed by teachers because of where they live. Students with citizenship felt more often treated unfairly especially in terms of gender (9.6\%) (Table 125).

When they are asked for inclusion at school (Tables 127 and 128), data are very similar in both groups. However, when they are asked about inclusion in general terms, students with citizenship are more inclusive (Table 129) and have more friends from different countries (Table 130).

## Religion - Well-being and everyday life

Because of the big difference in number of followers of the different religions, and to make the analysis feasible, the three groups used for the study are Christianity (33.6\%), Not affiliated (39.2\%), and Other religions (27.2\%) (Table 132). It is notable though that a sizeable number of students either didn't know what to answer (14.7\%) or didn't want to answer (3.8\%) the question (Table 131).

Students affiliated with Other religions tend to be more satisfied with life than the other groups, like who they are and show positive feelings about the future. Those who are not affiliated with a religion have the lowest satisfaction rates. However, they are the most likely to state that they have what they want in life. Christian students always hold a middle position (Table 133).

Other religions students generally participate in more organized activities in their leisure time. However, Christian students meet and play more often with friends outside school, so they are rarely spending time just being by themselves. Other religions students use digital technologies more often to stay in touch with friends (95\%), than Not affiliated (91.3\%) and Christians (90.3\%) (Table 134).

Regarding relationships of trust and safety, Christian students feel more supported by family and friends, and are more listened to by their parents. Other religions students feel that they have less support (Table 135).

In leisure time, those who are followers of other religions spend less time with school friends (Table 136). Christian students spend more time than the other groups with other friends face to face sometimes or often. Those who are not members of a religious group, on the other hand, sometimes or often spend more time online with their friends (Table 137).

## Religion - School life

Students of Other religions are the ones who sometimes or often feel happiest and most confident about being in school. However, Christian students show themselves as more belonging to the class. Non-religiously affiliated students are the group that feels the least happy or safe to be in school. They also have less sense of belonging to the class (Table 138). This is the group that feel less accepted by their classmates but more attended by teachers. However, acceptance by classmates and teachers in all cases is above $85 \%$. Christians feel that their teachers are inclusive more than the other two groups, although some of them suffer unfair treatment by teachers, especially related to the place they live and the language they speak (Table 139).

Regarding situations of bullying or harassment between classmates, non-denominational pupils suffer more teasing, hitting and voids than the rest. Christian students always suffer the least (Table 140).

Students not affiliated to any religion felt that they were treated unfairly because of their gender by teachers, but Christian students point to their peers. Pupils of Other religions feel treated unfairly mainly because of their economic status, religion, language, or nationality. In all cases they felt they were treated more unfairly by their classmates than by their teachers (Table 141). Other religions students stated that students are less allowed to speak in different languages (Table 142) and teachers speak in other languages with students less often (Table 143).

At the same time, students who do not belong to any religion are the group that perceived themselves to perform best in class (49.1\%), ahead of Christianity (35.7\%) and Other religions (33.6\%) (Table 144), and with more inclusive thinking. Although it is the group that
likes to have students with other backgrounds in class the least (Table 145). More than 90\% of students have friends from different countries, but especially students of Other religions (Table 146).

## Socio-economic status - Well-being and everyday life

Students without financial difficulties feel slightly more satisfied with life in general than those with some or many financial difficulties. At the same time, they feel more confident with their family and friends, and in their leisure time, their social life is richer, participating more often in organized activities and using smartphones or computers to stay in touch with their friends than students with more difficulties.

As there were only 17 responses of having difficulties in meeting financial needs, too small a number to be relevant for the analysis, this variable was recorded so that the responses of those with some difficulties and those with difficulties were merged into one group.

In general, the socio-economic situation of the participants does not seem to be a major problem and most of them have a financial situation without major difficulties. Only $3.3 \%$ reported difficulties in meeting their financial needs (table 147). Among the participants, life satisfaction (table 148) does not seem to have a strong association with the family's financial situation, as there are no significant differences in the responses on general life satisfaction, self-concept and expectations about the future. There are only differences associated with socio-economic status in the item "I have what I want in life", with a lower mean for the group reporting some financial difficulties.

In relation to the use of free time outside school (Table 149), we can observe significant inequalities that do not seem to be related to socio-economic status in all items. However, there are significant differences linked to the socio-economic status of the groups in the use of technological devices such as computers or smartphones.

In relationships with family and friends (table 150), we observed significant differences associated with socio-economic status in feeling listened to by their parents and supported by their friends when faced with problems. In these items, the group with some economic difficulties has a lower mean than the group that does not report difficulties. This leads us to think that a troubled socio-economic situation may be associated with a weakening of relationships with friends and family, probably due to a lack of financial means to participate in social life and the family tensions that this situation may generate.

Table 147 - Socio-economic status

|  | F | $\%$ |
| :--- | :---: | :---: |
| In our family, we do not have difficulties to cover our economic <br> necessities | 317 | $62.4 \%$ |
| In our family, we have some difficulties to cover our economic <br> necessities | 174 | $34.3 \%$ |
| In our family, we have difficulties to cover our economic necessities | 17 | $3.3 \%$ |

Socio-economic status - School life

Although both groups of students sometimes or often like to be in school, students with some or many economic difficulties (71.7\%) like it more than students with no economic difficulties ( $68.3 \%$ ). However, students without financial difficulties feel more belonging to the class ( $81.4 \%$ ) than the first group ( $76.3 \%$ ) and also feel more secure at school, and feel better when the teacher asks a question, or about how peers think about them (Table 153). In addition, this group appreciated more the support of their peers and teachers and the fact that they were listened to by them (Table 154), and suffered less situations of bullying (28.2\%) than students with some or many economic difficulties (45.9\%). Moreover, the group with no difficulties is less often left out of games or activities than the other group (Table 155). The main reasons why children feel they are treated unfairly by teachers (match in both groups) are the language they speak, the gender, and the place they live. Instead, the main reasons for unfair treatment by classmates, for students in the no economic difficulties group are gender, religion, and race, and for the other group gender, language they speak, and race (Table 156).

Usually, students are allowed to speak other languages (Table 157) and sometimes teachers speak to them in other languages (Table 158).

Regarding how students perceive their performance at school, students with no economic difficulties perform better than students with some or many economic difficulties. So, this last group reported worse results compared to their classmates (8.4\%) than the other group (5.6\%) (Table 159).

Students usually like to have classmates with different backgrounds (Table 160) and most of them, both students with no economic difficulties ( $94 \%$ ) or with them ( $92.5 \%$ ), have friends from different countries (Table 161).

4. Conclusions and discussion

## Overall population

There are several findings for the overall population. The first one is related to the selected sample and Spanish as a common language. The fact that schools invited to participate in this phase of the MiCREATE project have more migrant students than the average is reflected in the numbers. According to Instituto Nacional de Estadística ([INE] Spanish Statistical Office, 2020), the percentage of people born in countries other than Spain is $14.78 \%$, while in the sample of the survey is $20.9 \%$. This also can be explained because almost $80 \%$ of migrant students go to public schools (Ministerio de Educación y Formación Profesional [Ministry of education and Vocational Training], 2020). Of this 20.9\%, almost half ( $48 \%$ ) come from Latin American countries. This is because those countries have Spanish as an official language, so migrant families, when they come to Spain, don't have to deal with learning the host country's language.

In terms of their everyday life outside school, researchers found remarkable data related to students' leisure activities. The fact that $34 \%$ of respondents never or hardly ever participate in organised activities in their free time may be due to two main factors. On the one hand, students were in the middle of dealing with the Covid-19 pandemic, so it was a special year in which many leisure organisations offered far fewer activities than usual, and many families were scared to bring their students to activities outside of their family and their classroom 'bubble'. On the other hand, it also can be due to the fact that selected schools are labelled as 'high complexity' schools, and its population do not have enough resources to bring their students to organized activities after school hours. In this regard, Catalan ombudsman proposed 30 actions in order to avoid school segregation (Saura, 2019). Two of them relate to the creation of specific grants for extracurricular activities to ensure non-exclusion on economic grounds, and to involve Councils in such extracurricular activities.

Regarding students' school life, although usually students feel happy to go to school and many of them have friends from different cultures, some data revealed that schools still face challenges. First of all, they could further explore how to take more advantage of the richness of their cultural diversity. Secondly, they could work to ensure that no pupil feels unfairly treated on the basis of their migrant status (local students with migrant families included) by any member of the school. Unfortunately, in Spain there are still many schools that, without being fully aware of it, maintain or incur in acts of micro-racism in their classrooms and other spaces (Sepúlveda, 2017).

Another relevant fact is the cultural diversity of migrant and local students. Although many pupils found it difficult to understand what culture of origin meant, because they mixed their own ethnic, national, and civic identifications with their parents', many of them considered more than one culture of origin. Moreover, if we look at demographic data related to the three categories, we see that parents of many migrant students come from different countries. The fact that $14 \%$ of students feel that they belong to more than one
culture puts into question the common perception and the legal procedures that assign only one ethnic background to migrant students. This idea is boosted with the fact that almost $9 \%$ speak more than one language at home. All these data reinforce the phenomenon of transnational identities in migrant students and local students with migrant families, as well as reaffirm Naujoks' (2010, p. 21) assertion:
for research from the immigration and the country of origin perspective, there is an observable trend to overcome old dichotomies of 'here or there' and of being 'this or that' in favor of a more realistic conception of migrants, their lives and attachments and the interaction with the receiving society, fellow migrants, and their homelands.

According to Pavez-Soto (2016-2017) this implies "recognising that contemporary migrant students have grown up in transnational contexts, where they have multiple cultural belongings, histories and cultural backgrounds" (Pavez-Soto, 2016-2017, p. 111) and dismantles the preconception that migrant students' parents always come from solely one country.

Another insight about local students is that some of them responded with multiple cultures of origin but all of them belonged to different regions of Spain. This allows us to think that some local students born in Spain, also feel migrant because they come from other regions.

Looking at language issues, a relevant data is that many newly arrived (51\%) and longterm students (68.6\%) speak Catalan well (and 7.1\% of long-term students consider themselves to speak Catalan very well) (Table 47). This reinforces the idea that learning the compulsory languages of the host countries is a very important strategy in educational policies for the inclusion of immigrant students in Catalonia (Generalitat de Catalunya. Departament d'Educació, 2009).

Regarding their well-being and their life at school, most of the participants, regardless of their origin, felt satisfied with their lives and liked to go to school. However, more than 70\% expressed that teachers do not talk about different countries, languages, cultures, or religions in class. This indicates that schools still fall short in meeting the challenge of implementing culturally sensitive curricula (Estalayo et al., 2021).

## Newly arrived migrant children

A large number of students that migrated in the last years perceive that their legal situation is not regulated, or they are not aware of it, since $38.8 \%$ answered they did not have the Spanish citizenship and $36.7 \%$ did not know. Only $20 \%$ knew they had Spanish citizenship. At home, they speak the language of their parents' origin, but since the majority migrated from Latin American countries, the main language is Spanish (42.9\%). The majority of this cohort comes from Latin American and Muslim countries, and since these countries have a predominant religion, there is a correspondence in data: 37.5\% are affiliated to Christianism and $31.3 \%$ are affiliated to Islam (Table 54).

Regarding their socioeconomic status, 45.3\% of newly arrived migrant students perceive that their families have difficulties or some difficulties to cover their economic necessities. There is a 10 -point difference between long term migrants and local students, which indicates that families that recently migrated to Spain are the ones with more problems to cover their basic needs. This is coherent with research conducted in recent years that indicate that the poverty rate among migrant people is three times bigger than among locals (ECAS, 2020).

Almost every newly arrived migrant student is satisfied with their lives and school disaffection among this group is very low. They were the cohort of students that most liked being in school more often (56.3\%) and none of them answered that they did not like being at school at all. At the same time, only a few students felt that they were doing badly in school (7\%).

One of the most interesting results from the survey is related to their perceptions of being treated unfairly because of gender, nationality, economic status, or language. Newly arrived migrant students that expressed they were being treated unfairly because of gender reasons were very low ( $2.2 \%$ by teachers and $4.4 \%$ by students). But more relevant is that none of them perceived that they were being treated unfairly because of their nationality, economic status, and the language they speak by teachers. Only a few indicated they were treated unfairly because of their nationality (5\%), economic status (2.6\%), and language (9.5\%) by other students. This percentage is higher among long-term migrant students, which might indicate that when students arrive, they feel more welcomed and well treated than after some years.

## Long - term migrant children

The legal situation among long-term migrant students is clearer than among newly arrived students, being $40 \%$ the percentage that answered they had Spanish citizenship, while $32.9 \%$ did not know. One of the main differences between newly arrived and longterm migrant students is that the latter speak their parents' origin language and also Spanish. Almost 70\% of long-term students affirm that they also speak Catalan well. In terms of socioeconomic status, almost 40\% of long-term migrant students indicated they were having economic difficulties or some difficulties to cover their economic needs (37.5\%), which is very similar to local students' responses.

There were no differences between categories when students were asked how they feel in life. Most of them are satisfied with their lives. However, there are some differences in terms of schooling. Only $26.9 \%$ of long-term migrant students affirmed that they are doing very well in school, which is lower than the newly arrived and local children. The percentage of long-term students who felt they were doing badly is small, being 6\%. School disaffection among long-term students was quite low, since only $2.9 \%$ indicated they did not like it. However, the percentage of students who affirmed that they liked being in school often was $37.7 \%$, which is 20 points lower than for newly arrived migrant students. This difference
could indicate that students that recently migrated like being in school more than when they have been more years in the Spanish school system.

Long-term students were the ones that considered that they have been treated more unfairly because of gender reasons by their teachers (6.3\%) and classmates (15.4\%). Even more significant was the percentage of students that indicated that they have been treated unfairly because of their nationality. $4.9 \%$ affirmed they have been treated unfairly by teachers and $18.8 \%$ by students. Furthermore, this was the cohort that indicated feeling they belong less to their class, in relation with newly arrived migrant and local students. Considering these results, we could infer that long-term migrant students perceive they are treated slightly more unfairly than the other cohorts. At the same time, they feel they belong less than their peers that have been more years engaged in the Spanish school system.

## Local children

It is important to highlight that half of local students' families that answered the survey were not born in Spain (50.6\%), but in African, Latin American and Asian countries. This is the reason why some of them indicated that their ethnicity was Arabic, Moroccan, Ecuadorian, Pakistani, or Chinese. It is relevant that $2.5 \%$ of local students indicated that their ethnicity was Moroccan and at the same time Spanish. Also 5\% responded that their languages were Spanish and Arabic. This indicates that even though this is not a majority, some local students with migrant parents might tend to build a double ethnicity, which is defined as:

When identity comes modeled by the constant comparison between two "worlds" family and society-comparison that does not implicate definitive or extremist resolutions, but a constant process of selection and adjustment. In this way, the minor would be able to build an identity from harmonisation and integration of the values of both cultures, and among all, the development of a feeling of double belonging (Giulio, 2019: 45).

In terms of socio-economic status, it was relevant that the percentage of local students that perceived that their families were having difficulties or some difficulties covering their economic necessities was quite high (36.5\%) and very similar to long-term migrant students. This might indicate that students from the schools that participate in the survey come from low economic status families, independently of their ethnic origin.

Similarly to the other cohorts, local students felt satisfied with their lives. However, on the one hand, disaffection towards school was higher than among long-term and newly arrived migrant students since a smaller percentage answered they often like being in school ( $28.9 \%$ ). On the other hand, the percentage of local students indicating they were doing good was higher than among the other cohorts (40.1\%). This figure is significantly higher than that of newly arrived migrant students.

In terms of treatment by their teachers, the number of local students that expressed that they were treated unfairly because of gender reasons by their teachers was $4.7 \%$ and by
students $10.1 \%$. This perception was higher than among newly arrived migrant students ( T : $2.2 \%, \mathrm{~S}: 4.4 \%$ ), but lower than among long-term migrant students ( $\mathrm{T}: 6.3 \%, \mathrm{~S}: 15.4 \%$ ).

If we compare the data to other reports produced with the MiCREATE, according to the report Political and Media Discourse Analysis and Review of Public Opinion (MiCREATE, 2019a), more than half of the population in Spain has a positive ( $46.3 \%$ ) or very positive (5.3\%) perception of migration in Spain. However, students participating in the survey perceived positive migration in a higher percentage (around $80 \%$ ). This can be explained by the fact that these students live in neighbourhoods and go to schools with a high percentage of migration, so migration is part of their environment and normality.

Despite some stakeholders interviewed during WP3 (MiCREATE, 2019b) claiming different conditions of life between migrant and local students, most of the participants of the survey felt happy with the style of life they have. However, there is a coincidence on the need of training teachers (and the whole educational community) in intercultural issues (MiCREATE, 2019b, p. 61).

According to the report Educational Community and School Systems: Spain (MiCREATE, 2019c), "teachers also need to be guided and accompanied when they arrive at a school with students with migrant backgrounds" (MiCREATE, 2019c, p. 9).

Whilst members from educational communities perceive the neighbourhoods as ghettos or having urban deficiencies (MiCREATE, 2019c), participants in the survey mainly feel happy with their lives outside school. In a similar way, participants interviewed in the same report manifested that the schools of the sample did not reflect the neighbourhoods' real demography. And talked again of ghettoized schools in a dismissive tone. However, in the survey, many students felt happy with their schools.

Although some schools have 'Coexistence Plans' (MiCREATE, 2019c), still some students have felt treated unfairly by their teachers and classmates in school.
